

Wisconsin Standards for Science 2017

Vision

Our communities and our state need scientifically literate citizens who can make informed decisions, help manage our abundant resources, and move our economy forward. In a world of continual innovation and discovery, students across Wisconsin must have the ability to apply scientific thinking, skills, and understanding to real-world phenomena and problems. Therefore, student learning must include experiences requiring that type of work.

The National Research Council issued [A Framework for K-12 Science Education](#) (2012), laying out an expectation for high school graduates that provides a succinct vision for science education supported by Wisconsin educators: “[By] the end of 12th grade, all students have some appreciation of the beauty and wonder of science; possess sufficient knowledge of science and engineering to engage in public discussions on related issues; are careful consumers of scientific and technological information related to their everyday lives; are able to continue to learn about science outside school; and have the skills to enter careers of their choice, including (but not limited to) careers in science, engineering, and technology.” All Wisconsin students need these skills to be able to address societal problems we are facing and new challenges that will arise.

Reflecting on this statewide vision, educators should work with their colleagues and local communities to create their own visions for science education based on their unique contexts.

Process

These Wisconsin Standards for Science were written by a committee of educators, scientists, and engineers from across Wisconsin who were tasked with delineating what content, practices, and ways of thinking were critical for Wisconsin students’ development into scientifically literate citizens ready for college and career success. This work was informed by the *National Research Council’s Framework for K-12 Science Education* and the *Next Generation Science Standards* as foundational supports. One significant contribution of this Wisconsin writing committee was adding specific Wisconsin contexts to these science concepts in order to support making science relevant and engaging across our communities.

Explanatory Materials - How to Read the Standards

The new Wisconsin standards across all disciplines are formatted from a common template to support educators in reading and interpreting them. The discipline is clearly stated at the top of the template. In the case of the science standards, there are three sections: crosscutting concept standards, science and engineering practice standards, and science content standards, in that order. The three sections are color coded. Crosscutting concept standards are in green. Science and engineering practice standards are in blue. Content standards are in orange. Every series of lessons should integrate these three dimensions; they should not be taught or assessed in isolation.

Structure, Development, and Language of the Science Content Standards

The science content standards are further divided into standards in life science (LS); physical science (PS); earth and space science (ESS); and engineering, technology, and science applications (ETS). The figure below shows a sample standard from the life science content area.

LIFE SCIENCE

Standard SCI.LS1: Students use science and engineering practices, crosscutting concepts, and an understanding of **structures and processes** (on a scale from molecules to organisms) to make sense of phenomena and solve problems.

The code, “**Standard SCI.LS1**” is translated as follows: Science.Life Science Content Area Standard 1-- which pertains to the content area of **structures and processes**.

The standards statements for content, practices, and crosscutting concepts are based on the foundational phrase, “Students use science and engineering practices, crosscutting concepts, and an understanding of content to make sense of phenomena and solve problems.” Depending on the standard, the specific crosscutting concept, practice, or content topic will be underlined in the statement. In this case, the content of “structures and processes from molecules to organisms,” fills the blank. As noted above, these three dimensions should always be used together to frame instruction, not in isolation.

The standards statements emphasize that students should be engaging in three-dimensional science learning from kindergarten through grade 12, meaning that they learn the content standards by engaging in the scientific and engineering practice standards while using the perspectives of the crosscutting concepts to think like scientists.

Each content standard statement is further divided into **learning elements** and **performance indicators**. In the figure below, the code **SCI.LS1.A** refers to learning element A of life science standard statement 1. Each standard statement has from 1-5 learning elements, which are subareas of the overarching content, practice, or crosscutting concept on the page. The **performance indicators** provide a learning progression from grade band to grade band for each learning element. **Notably**, these statements only become “performance indicators” when placed in the context of the standards statement at the top of each page: “Students use science and engineering practices, crosscutting concepts, and an understanding of content to make sense of phenomena and solve problems.” Each performance indicator is associated with a suggested grade level within the elementary school grade bands; the code for the performance indicator notes the appropriate grade level at the end. For example, **SCI.LS1.A.1** refers to the developmentally appropriate understanding of structure and function for the K-2 grade band, and it is suggested that this content be learned in grade 1. These grade levels are recommended to support consistency across the state and student transfers between districts. With local control, districts can assign performance indicators to elementary grade levels that better fit their needs.

Performance indicators for the middle school and high school grade bands are not associated with suggested grade levels, so the grade level codes for these grade bands are “m” for middle school and “h” for high school. Some districts may choose an integrated course format while others may choose to organize classes by discipline. There is not a recommended method. Appendix K of the *Next Generation Science Standards* (NGSS Lead States, 2013) includes several ideas for structuring secondary science courses.

The high school standards include content, skills, and ways of thinking, forming the core learning for *all* students. Advanced and elective science coursework should move beyond the content noted here, though the practice and crosscutting concept standards should remain an integral part of instruction.

It bears repeating that all standards statements have a similar structure with a blank that is filled by a specific grade level learning element. The performance indicators should be read as appropriately filling in the overarching standards statement at the beginning of each section. For example, performance indicator **SCI.LS1.A.1** can be read as “Students use science and engineering practices, crosscutting concepts, and an understanding that all organisms have external parts that they use to perform daily functions to make sense of phenomena and solve problems.” When considered within this three-dimensional framework, performance indicators provide a measurable component(s) for educators to use in assessing student learning.

Some learning elements boxes are intentionally left blank where it is not developmentally appropriate to teach a particular science topic at that grade level.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.LS1.A: Structure and Function	SCI.LS1.A.1 All organisms have external parts that they use to perform daily functions.	SCI.LS1.A.4 Plants and animals have both internal and external macroscopic structures that allow for growth, survival, behavior, and reproduction.	SCI.LS1.A.m All living things are made up of cells. In organisms, cells work together to form tissues and organs that are specialized for particular body functions.	SCI.LS1.A.h Systems of specialized cells within organisms help perform essential functions of life. Any one system in an organism is made up of numerous parts. Feedback mechanisms maintain an organism's internal conditions within certain limits and mediate behaviors.
SCI.LS1.B: Growth and Development of Organisms	SCI.LS1.B.1 Parents and offspring often engage in behaviors that help the offspring survive.	SCI.LS1.B.3 Reproduction is essential to every kind of organism. Organisms have unique and diverse life cycles.	SCI.LS1.B.m Animals engage in behaviors that increase the odds of reproduction. An organism's growth is affected by both genetic and environmental factors.	SCI.LS1.B.h Growth and division of cells in organisms occurs by mitosis and differentiation for specific cell types.

It is important to note that there are no performance indicators listed for 4K. Our committee suggests that educators use the [Wisconsin Model Early Learning Standards](#) to guide their work as they take advantage of the natural connections to science that come up every day in an effective 4K experience. Some suggestions for 4K teachers include supporting student experiences by encouraging students to ask questions and make observations as they play. 4K classes in which teachers ask, "What did you notice?" "What do you wonder?" "What does this remind you of?" and "What does it feel like, sound like, smell like, taste like, look like?" are more likely to come alive with authentic exploration that allows young children opportunities to figure things out and develop their own explanations as they interact with their world.

As stated earlier, these standards are designed to encourage instruction and learning that is “**three dimensional**,” i.e., instruction and learning that includes content taught through engagement in science and engineering practices in the context of crosscutting concepts. This is a new way of doing business in the world of science education. The standards documents include performance indicators that are provided as examples of ways to weave particular content, practices, and ways of thinking together for the purpose of assessing student learning in a three dimensional context. With the exception of the ETS3 standards, which were developed in Wisconsin, these performance indicators come from the Next Generation Science Standards. These sample performance indicators provide guidance for the development of the 4th and 8th grade Forward Exam, but they are not meant to guide curriculum and instruction. That process should be guided by local leaders discussing how to best connect these three dimensions based on their instructional preferences and student needs. Groups of science educators may wish to create their own three dimensional performance indicators. See the figure below for the K-2 LS1 examples.

SCI.LS1: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS	
Grades K-2	<p>K-LS1-1. Use observations to describe patterns of what plants and animals (including humans) need to survive.</p> <p>1-LS1-1. Use materials to design a solution to a human problem by mimicking how plants and/or animals use their external parts to help them survive, grow, and meet their needs.</p> <p>1-LS1-2. Read texts and use media to determine patterns in behavior of parents and offspring that help offspring survive.</p>

The statements are coded to indicate grade levels and the associated content standard. For example, the performance indicator **K-LS1-1** was created as an example of a kindergarten (K) indicator associated with standard LS1. The number at the end simply specifies that this is kindergarten sample performance indicator number 1 in order to assist in communication.

Structure, Development, and Language of the Crosscutting Concepts Standards

There are seven crosscutting concepts standards. These crosscutting concepts detail how scientists and engineers think as they approach phenomena and problems. They are the lenses from which they approach the world. They should form the basis for the type of questions students ask and the analysis students do as they engage in authentic professional practice to understand core science ideas. The standards page starts with a foundational, three-dimensional phrase, and each performance indicator should be read as part of this phrase. For example, the example below starts, “Students use science and engineering practices, disciplinary core ideas, and **patterns** to make sense of phenomena and solve problems.” Each performance indicator statement in each grade band would be read within this phrase, taking the place of the segment in bold. The coding of the crosscutting concept standard statements and performance indicators follows the same pattern as the science and engineering practice standards, with one exception. Since the crosscutting concept standards are not divided into “learning elements,” the codes have one less numerical part. A sample is shown in the figure below.

CROSSCUTTING CONCEPTS				
Standard SCI.CC1: Students use science and engineering practices, disciplinary core ideas, and patterns to make sense of phenomena and solve problems.				
Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Patterns	SCI.CC1.K-2 Students recognize that patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.	SCI.CC1.3-5 Students identify similarities and differences in order to sort and classify natural objects and designed products. They identify patterns related to time, including simple rates of change and cycles, and use these patterns to make predictions.	SCI.CC1.m Students recognize that macroscopic patterns are related to the nature of microscopic and atomic-level structure. They identify patterns in rates of change and other numerical relationships that provide information about natural and human-designed systems. They use patterns to identify cause and effect relationships and use graphs and charts to identify patterns in data.	SCI.CC1.h Students observe patterns in systems at different scales and cite patterns as empirical evidence for causality in supporting their explanations of phenomena. They recognize classifications or explanations used at one scale may not be useful or need revision using a different scale, thus requiring improved investigations and experiments. They use mathematical representations to identify and analyze patterns of performance in order to reengineer a designed system.

Structure, Development, and Language of the Science and Engineering Practice Standards

There are eight science and engineering practice standards built from Appendix F of the Next Generation Science Standards. These practice standards detail the work of scientists and engineers, suggesting the types of skills students should be using as they learn core concepts and how to think like scientists and engineers. Each standard is further divided into learning elements and performance indicators. The standards page starts with a foundational, three-dimensional phrase, and each performance indicator should be read as part of this phrase. For example, the standard below starts, “Students ***ask questions and define problems***, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.” Each performance indicator statement would be read within this phrase, taking the place of the segment in bold. The science and engineering practices are not intended as the focus of a stand alone lesson or unit, but should be integrated with the other two dimensions in the course of science instruction. The coding of the science and engineering practice standards statements, learning elements, and performance indicators follows the same pattern as the content standards with one exception: The performance indicators for the K-2 and 3-5 grade bands are not identified by grade level, only grade band. A sample is shown in the figure below.

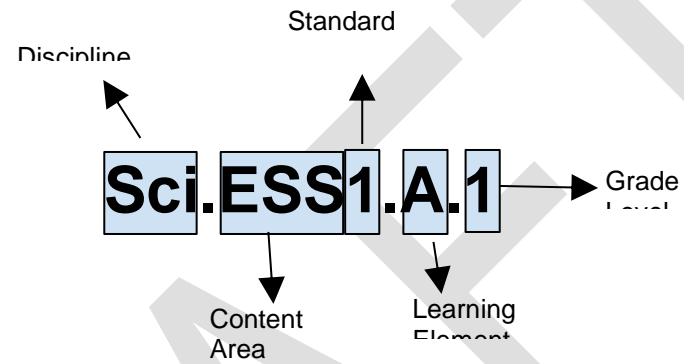

SCIENCE AND ENGINEERING PRACTICES				
Standard SCI.SEP1: Students <i>ask questions and define problems</i> , in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.				
Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP1.A: Asking Questions	SCI.SEP1.A.K-2 Students ask simple descriptive questions that can be tested. This includes the following: Ask questions based on observations to find more information about the natural world. Ask and/or identify questions that can be answered by an investigation.	SCI.SEP1.A.3-5 Students ask questions that specify qualitative relationships. This includes the following: Ask questions about what would happen if a variable is changed. Identify scientific (testable) and non-scientific (non-testable) questions. Ask questions that can be investigated and predict reasonable outcomes based on patterns such as cause and effect relationships.	SCI.SEP1.A.m Students ask questions to specify relationships between variables and clarify arguments and models. This includes the following: Ask questions that arise from careful observation of phenomena, models, or unexpected results, to clarify and/or seek additional information. Ask questions to identify and/or clarify evidence and/or the premise(s) of an argument. Ask questions to determine relationships between independent and dependent variables and relationships in models.	SCI.SEP1.A.h Students ask questions to formulate, refine, and evaluate empirically testable questions. This includes the following: Ask questions that arise from careful observation of phenomena, or unexpected results, to clarify and/or seek additional information. Ask questions that arise from examining models or theories to clarify and/or seek additional information and relationships. Ask questions to determine relationships, including quantitative relationships, between independent and dependent variables.

Appendix A: Real-World Connections

The vision for the new Wisconsin State Science Standards outlines the importance of providing opportunities for students to apply scientific thinking, skills, and understanding to real-world phenomena and problems. In order to achieve this, the standards committee decided to highlight Appendix A here, as it consists of real-world connections that are specific to Wisconsin, as well as connections to engineering and technology, for most science content standard statements (some boxes are blank where the writing committee could not think of ideas). The figure below shows an example of connections to the **SCI.LS1 -- Organisms** standard. These connections are listed by grade band, but many are applicable across multiple grade bands. The connections note which learning element progression they connect to (such as LS1.A). This section is shaded grey to emphasize that these examples are not a required part of the standards. Teachers are encouraged to connect to local phenomena and meaningful engineering problems that make sense in their instruction and their community for their students.

LIFE SCIENCE				
Standard SCI.LS1: Students use science and engineering practices, crosscutting concepts, and an understanding of structures and processes (on a scale from molecules to organisms) to make sense of phenomena and solve problems.				
	K-2	3-5	6-8	9-12
SCI.LS1: CONNECTIONS				
Example Wisconsin Connections	<p>Wisconsin plants (e.g., burdock, maple trees, and black walnut trees) have structures for seed dispersal (LS1.A).</p> <p>Badgers' claws are long and sharp and allow them to dig quickly (LS1.A).</p>	<p>Explore concepts in this standard using native Wisconsin animals such as the grey wolf, badger, beaver, and red fox (LS1.A, B).</p> <p>Wood turtles respond to changing weather conditions by burrowing under the mud on the bank of a river and emerging again when conditions are favorable (LS1.A).</p> <p>Many species of Wisconsin bats hibernate during the winter (LS1.A).</p>	<p>Climate change has an effect on Wisconsin plants such as wild rice (LS1.B).</p> <p>Crops grown in Wisconsin can be converted to Biofuels (LS1.C).</p> <p>Genetically modifying crops can influence their growth (LS1.C).</p> <p>An animal's chance of survival may increase due to certain behaviors. Examples include:</p> <ul style="list-style-type: none"> –Winter "yarding" behavior among deer; –The seasonal migration of geese and cranes; –The hibernation of bears and bats (LS1.B, D). 	<p>Wisconsin Fast Plants allow students to investigate and model energy dynamics in living systems (LS1.C).</p> <p>By-products of fermentation industries are used to provide energy for the fermentation processes (LS1.C).</p> <p>Coppice cutting is a system of woodland management in Wisconsin that involves harvesting trees and allowing the stumps to produce new growth (LS1.B).</p>
Engineering, Technology & Society Connections	<p>Engineers use inspiration from nature in designs (biomimicry). Examples include Velcro and burr structures, and lotus leaf and waterproofing methods.</p> <p>Engineers design limbs for amputees.</p>	<p>Engineers design prosthetics and other artificial devices such as hearing aids and cochlear implants.</p>	<p>Engineers develop fuels from biological raw materials (biofuels).</p> <p>Engineers can alter biological organisms through genetic engineering.</p>	<p>One of the National Academy of Engineering Grand Challenges includes reverse engineering the brain to figure out how the brain works.</p>

Summary: How to read the standards codes for a performance indicator

“Content areas” in this code structure include:

- LS - Life Science
- PS - Physical Science
- ESS - Earth and Space Science
- ETS - Engineering, Technology, and Society
- SEP - Science and Engineering Practices
- CC - Crosscutting Concepts

Discipline: SCIENCE

CROSSCUTTING CONCEPTS

Standard SCI.CC1: Students use science and engineering practices, disciplinary core ideas, and ***patterns*** to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Patterns	SCI.CC1.K-2 Students recognize that patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.	SCI.CC1.3-5 Students identify similarities and differences in order to sort and classify natural objects and designed products. They identify patterns related to time, including simple rates of change and cycles, and use these patterns to make predictions.	SCI.CC1.m Students recognize that macroscopic patterns are related to the nature of microscopic and atomic-level structure. They identify patterns in rates of change and other numerical relationships that provide information about natural and human-designed systems. They use patterns to identify cause and effect relationships and use graphs and charts to identify patterns in data.	SCI.CC1.h Students observe patterns in systems at different scales and cite patterns as empirical evidence for causality in supporting their explanations of phenomena. They recognize classifications or explanations used at one scale may not be useful or need revision using a different scale, thus requiring improved investigations and experiments. They use mathematical representations to identify and analyze patterns of performance in order to reengineer a designed system.

Standard SCI.CC2: Students use science and engineering practices, disciplinary core ideas, and ***cause and effect*** relationships to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Cause and Effect	SCI.CC2.K-2 Students learn that events have causes that generate observable patterns. They design simple tests to gather evidence to support or refute their own ideas about causes.	SCI.CC2.3-5 Students routinely identify and test causal relationships and use these relationships to explain change. They understand events that occur together with regularity may or may not signify a cause and effect	SCI.CC2.m Students classify relationships as causal or correlational, and recognize that correlation does not necessarily imply causation. They use cause and effect relationships to predict phenomena in natural or	SCI.CC2.h Students understand that empirical evidence is required to differentiate between cause and correlation and to make claims about specific causes and effects. They suggest cause and effect relationships to

		relationship.	designed systems. They also understand that phenomena may have more than one cause, and some cause and effect relationships in systems can only be explained using probability.	explain and predict behaviors in complex natural and designed systems. They also propose causal relationships by examining what is known about smaller scale mechanisms within the system. They recognize changes in systems may have various causes that may not have equal effects.
--	--	---------------	---	---

Standard SCI.CC3: Students use science and engineering practices, disciplinary core ideas, and an understanding of ***scale, proportion and quantity*** to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Scale, Proportion, and Quantity	SCI.CCS3.K-2 Students use relative scales (e.g., bigger and smaller; hotter and colder; faster and slower) to describe objects. They use standard units to measure length.	SCI.CCS3.3-5 Students recognize natural objects and observable phenomena exist from the very small to the immensely large. They use standard units to measure and describe physical quantities such as mass, time, temperature, and volume.	SCI.CCS3.m Students observe time, space, and energy phenomena at various scales using models to study systems that are too large or too small. They understand phenomena observed at one scale may not be observable at another scale, and the function of natural and designed systems may change with scale. They use proportional relationships (e.g., speed as the ratio of distance traveled to time taken) to gather information about the magnitude of properties and processes. They represent scientific relationships through the use of algebraic expressions and equations.	SCI.CCS3.h Students understand the significance of a phenomenon is dependent on the scale, proportion, and quantity at which it occurs. They recognize patterns observable at one scale may not be observable or exist at other scales, and some systems can only be studied indirectly as they are too small, too large, too fast, or too slow to observe directly. They use orders of magnitude to understand how a model at one scale relates to a model at another scale. They use algebraic thinking to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth vs. exponential growth).

Standard SCI.CC4: Students use science and engineering practices, disciplinary core ideas, and an understanding of ***systems***

and models to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Systems and System Models	SCI.CC4.K-2 Students understand objects and organisms can be described in terms of their parts and that systems in the natural and designed world have parts that work together.	SCI.CC4.3-5 Students understand that a system is a group of related parts that make up a whole and can carry out functions its individual parts cannot. They also describe a system in terms of its components and their interactions.	SCI.CC4.m Students understand that systems may interact with other systems: they may have sub-systems and be a part of larger complex systems. They use models to represent systems and their interactions—such as inputs, processes, and outputs—and energy, matter, and information flows within systems. They also learn that models are limited in that they only represent certain aspects of the system under study.	SCI.CC4.h Students investigate or analyze a system by defining its boundaries and initial conditions, as well as its inputs and outputs. They use models (e.g., physical, mathematical, computer models) to simulate the flow of energy, matter, and interactions within and between systems at different scales. They also use models and simulations to predict the behavior of a system, and recognize that these predictions have limited precision and reliability due to the assumptions and approximations inherent in the models. They also design systems to do specific tasks.

Standard SCI.CC5: Students use science and engineering practices, disciplinary core ideas, and an understanding of **energy and matter** to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Energy and Matter	SCI.CC5.K-2 Students observe objects may break into smaller pieces, be put together into larger pieces, or change shapes.	SCI.CC5.3-5 Students understand matter is made of particles and energy can be transferred in various ways and between objects. Students observe the conservation of matter by tracking matter flows and cycles before and after processes, recognizing the total mass of substances does not change.	SCI.CC5.m Students understand matter is conserved because atoms are conserved in physical and chemical processes. They also understand that within a natural or designed system the transfer of energy drives the motion and/or cycling of matter. Energy may take different forms (e.g. energy in fields, thermal	SCI.CC5.h Students understand that the total amount of energy and matter in closed systems is conserved. They describe changes of energy and matter in a system in terms of energy and matter flows into, out of, and within that system. They also learn that energy cannot be created or destroyed. It only moves

		<i>Note: In this grade band, students are not expected to be able to differentiate between mass and weight.</i>	energy, energy of motion). The transfer of energy can be tracked as energy flows through a designed or natural system.	between one place and another place, between objects and/or fields, or between systems. Energy drives the cycling of matter within and between systems. In nuclear processes, atoms are not conserved, but the total number of protons plus neutrons is conserved.
--	--	---	--	--

Standard SCI.CC6: Students use science and engineering practices, disciplinary core ideas, and an understanding of ***structure and function*** to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Structure and Function	SCI.CC6.K-2 Students observe the shape and stability of structures of natural and designed objects are related to their function(s).	SCI.CC6.3-5 Students understand different materials have different substructures, which can sometimes be observed; and substructures have shapes and parts that serve functions.	SCI.CC6.m Students model complex and microscopic structures and systems and visualize how their function depends on the shapes, composition, and relationships among their parts. They analyze many complex natural and designed structures and systems to determine how they function. They design structures to serve particular functions by taking into account properties of different materials, and how materials can be shaped and used.	SCI.CC6.h Students investigate systems by examining the properties of different materials, the structures of different components, and their interconnections to reveal the system's function and/or solve a problem. They infer the functions and properties of natural and designed objects and systems from their overall structure, the way their components are shaped and used, and the molecular substructures of their various materials.

Standard SCI.CC7: Students use science and engineering practices, disciplinary core ideas, and an understanding of ***stability and change*** to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
Stability and Change	SCI.CC7.K-2 Students observe some things stay the same while other things change,	SCI.CC7.3-5 Students measure change in terms of differences over time, and	SCI.CC7.m Students explain stability and change in natural or designed	SCI.CC7.h Students understand much of science deals with constructing

	and things may change slowly or rapidly.	observe that change may occur at different rates. They understand some systems appear stable, but over long periods of time they will eventually change.	systems by examining changes over time, and considering forces at different scales, including the atomic scale. They understand changes in one part of a system might cause large changes in another part, systems in dynamic equilibrium are stable due to a balance of feedback mechanisms, and stability might be disturbed by either sudden events or gradual changes that accumulate over time.	explanations of how things change and how they remain stable. They quantify and model changes in systems over very short or very long periods of time. They see some changes are irreversible, and negative feedback can stabilize a system, while positive feedback can destabilize it. They recognize systems can be designed for greater or lesser stability.

SCIENCE AND ENGINEERING PRACTICES

Standard SCI.SEP1: Students *ask questions and define problems*, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP1.A: Asking Questions	<p>SCI.SEP1.A.K-2 Students ask simple descriptive questions that can be tested. This includes the following:</p> <p>Ask questions based on observations to find more information about the natural world.</p> <p>Ask and/or identify questions that can be answered by an investigation.</p>	<p>SCI.SEP1.A.3-5 Students ask questions that specify qualitative relationships. This includes the following:</p> <p>Ask questions about what would happen if a variable is changed.</p> <p>Identify scientific (testable) and non-scientific (non-testable) questions.</p> <p>Ask questions that can be investigated and predict reasonable outcomes based on patterns such as cause and effect relationships.</p>	<p>SCI.SEP1.A.m Students ask questions to specify relationships between variables and clarify arguments and models. This includes the following:</p> <p>Ask questions that arise from careful observation of phenomena, models, or unexpected results, to clarify and/or seek additional information.</p> <p>Ask questions to identify and/or clarify evidence and/or the premise(s) of an argument.</p> <p>Ask questions to determine relationships between independent and dependent variables and relationships in models.</p> <p>Ask questions to clarify and/or refine a model, an explanation, or an engineering problem.</p> <p>Ask questions that require sufficient and appropriate empirical evidence to answer.</p> <p>Ask questions that can be investigated within the scope of the classroom, outdoor environment,</p>	<p>SCI.SEP1.A.h Students ask questions to formulate, refine, and evaluate empirically testable questions. This includes the following:</p> <p>Ask questions that arise from careful observation of phenomena, or unexpected results, to clarify and/or seek additional information.</p> <p>Ask questions that arise from examining models or theories to clarify and/or seek additional information and relationships.</p> <p>Ask questions to determine relationships, including quantitative relationships, between independent and dependent variables.</p> <p>Ask questions to clarify and refine a model or an explanation.</p> <p>Evaluate a question to determine if it is testable and relevant.</p> <p>Ask questions that can be investigated within the scope of the school laboratory, research facilities, or field (e.g., outdoor environment) with available</p>

			and museums and other public facilities with available resources and, when appropriate, frame a hypothesis based on observations and scientific principles. Ask questions that challenge the premise(s) of an argument or the interpretation of a data set.	resources and, when appropriate, frame a hypothesis based on a model or theory. Ask and/or evaluate questions that challenge the premise(s) of an argument, the interpretation of a data set, or the suitability of the design.
SCI.SEP1.B: Defining Problems	SCI.SEP1.B.K-2 Students define simple problems that can be solved through the development of a new or improved object or tool.	SCI.SEP1.B.3-5 Students use prior knowledge to describe and define simple design problems that can be solved through the development of an object, tool, process, or system. They include several criteria for success and constraints on materials, time, or cost.	SCI.SEP1.B.m Students define a design problem that can be solved through the development of an object, tool, process, or system, and includes multiple criteria and constraints, including scientific knowledge that may limit possible solutions.	SCI.SEP1.B.h Students formulate, refine, and evaluate design problems using models and simulations. This includes the following: Define a design problem that involves the development of a process or system with interacting components and criteria and constraints that may include social, technical, and/or environmental considerations. Clarify and refine an engineering problem.
Standard SCI.SEP2: Students <i>develop and use models</i>, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.				
Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP2.A: Developing Models	SCI.SEP2.A.K-2 Students use and develop models (i.e., diagrams drawings, physical replicas, dioramas, dramatizations, or storyboards) that represent concrete events or design solutions.	SCI.SEP2.A.3-5 Students build and revise simple models and use models to represent events and design solutions. This includes the following:	SCI.SEP2.A.m Students develop, use, and revise models to describe, test, and predict more abstract phenomena and design systems. This includes the following:	SCI.SEP2.A.h Students use, synthesize, and develop models to predict and show relationships among variables between systems and their components in the natural and

	<p>This includes the following:</p> <p>Distinguish between a model and the actual object, process, and/or events the model represents.</p> <p>Compare models to identify common features and differences. Develop and/or use a model to represent amounts, relationships, relative scales (bigger, smaller), and/or patterns in the natural and designed world(s).</p> <p>Develop a simple model based on evidence to represent a proposed object or tool.</p>	<p>Identify limitations of models.</p> <p>Collaboratively develop and/or revise a model based on evidence that shows the relationships among variables for frequent and regular occurring events.</p> <p>Develop a model using an analogy, example, or abstract representation to describe a scientific principle or design solution.</p> <p>Develop and/or use models to describe and/or predict phenomena.</p> <p>Develop a diagram or simple physical prototype to convey a proposed object, tool, or process.</p> <p>Use a model to test cause and effect relationships or interactions concerning the functioning of a natural or designed system.</p>	<p>Evaluate limitations of a model for a proposed object or tool.</p> <p>Develop or modify a model—based on evidence – to match what happens if a variable or component of a system is changed.</p> <p>Use and/or develop a model of simple systems with uncertain and less predictable factors.</p> <p>Develop and/or revise a model to show the relationships among variables, including those that are not observable but predict observable phenomena.</p> <p>Develop and/or use a model to predict and/or describe phenomena.</p> <p>Develop a model to describe unobservable mechanisms.</p> <p>Develop and/or use a model to generate data to test ideas about phenomena in natural or designed systems, including those representing inputs and outputs, and those at unobservable scales.</p>	<p>designed world. This includes the following:</p> <p>Evaluate merits and limitations of two different models of the same proposed tool, process, mechanism, or system in order to select or revise a model that best fits the evidence or design criteria.</p> <p>Design a test of a model to ascertain its reliability.</p> <p>Develop, revise, and/or use a model based on evidence to illustrate and/or predict the relationships between systems or between components of a system.</p> <p>Develop and/or use multiple types of models to provide mechanistic accounts and/or predict phenomena, and move flexibly between model types based on merits and limitations.</p> <p>Develop a complex model that allows for manipulation and testing of a proposed process or system.</p> <p>Develop and/or use a model (including mathematical and computational) to generate data to support explanations, predict phenomena, analyze systems, and/or solve problems.</p>
--	--	---	--	--

Standard SCI.SEP3: Students *plan and carry out investigations*, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP3.A: Planning and Conducting Investigations	<p>SCI.SEP3.A.K-2 Students plan and carry out simple investigations, based on fair tests, which provide data to support explanations or design solutions. This includes the following:</p> <p>With guidance, plan and conduct an investigation in collaboration with peers (for K).</p> <p>Plan and conduct an investigation collaboratively to produce data to serve as the basis for evidence to answer a question.</p> <p>Evaluate different ways of observing and/or measuring a phenomenon to determine which way can answer the question being studied.</p> <p>Make observations (firsthand or from media) and/or measurements to collect data that can be used to make comparisons.</p> <p>Make observations (firsthand or from media) and/or measurements of a proposed object or tool or solution to determine if it solves a problem or meets a goal.</p> <p>Make predictions based on prior experiences.</p>	<p>SCI.SEP3.A.3-5 Students plan and carry out investigations that control variables and provide evidence to support explanations or design solutions. This includes the following:</p> <p>Plan and conduct an investigation collaboratively to produce data to serve as the basis for evidence, using fair tests in which variables are controlled and the number of trials considered.</p> <p>Evaluate appropriate methods and/or tools for collecting data.</p> <p>Make observations and/or measurements to produce data to serve as the basis for evidence for an explanation of a phenomenon or test a design solution.</p> <p>Make predictions about what would happen if a variable changes.</p> <p>Test two different models of the same proposed object, tool, or process to determine which better meets criteria for success.</p>	<p>SCI.SEP3.A.m Students plan and carry out investigations that use multiple variables and provide evidence to support explanations or solutions. This includes the following:</p> <p>Plan an investigation individually and collaboratively, and in the design: identify independent and dependent variables and controls, what tools are needed to do the gathering, how measurements will be recorded, and how many data are needed to support a claim.</p> <p>Conduct an investigation and/or evaluate and/or revise the experimental design to produce data to serve as the basis for evidence that meet the goals of the investigation.</p> <p>Evaluate the accuracy of various methods for collecting data.</p> <p>Collect data to produce data to serve as the basis for evidence to answer scientific questions or test design solutions under a range of conditions.</p> <p>Collect data about the performance of a proposed object, tool, process,</p>	<p>SCI.SEP3.A.h Students plan and carry out investigations that provide evidence for and test conceptual, mathematical, physical, and empirical models: This includes the following:</p> <p>Plan an investigation or test a design individually and collaboratively to produce data to serve as the basis for evidence as part of building and revising models, supporting explanations for phenomena, or testing solutions to problems. Consider possible variables or effects and evaluate the confounding investigation's design to ensure variables are controlled.</p> <p>Plan and conduct an investigation individually and collaboratively to produce data to serve as the basis for evidence, and in the design: decide on types, how much, and accuracy of data needed to produce reliable measurements, and consider limitations on the precision of the data (e.g., number of trials, cost, risk, time), and refine the design accordingly.</p> <p>Plan and conduct an investigation or test a design solution in a safe and</p>

			or system under a range of conditions.	<p>ethical manner including considerations of environmental, social, and personal impacts.</p> <p>Select appropriate tools to collect, record, analyze, and evaluate data.</p> <p>Make directional hypotheses that specify what happens to a dependent variable when an independent variable is manipulated.</p> <p>Manipulate variables and collect data about a complex model of a proposed process or system to identify failure points or improve performance relative to criteria for success or other variables.</p>
--	--	--	--	--

Standard SCI.SEP4: Students *analyze and interpret data*, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP4.A: Analyze and Interpret Data	<p>SCI.SEP4.A.K-2 Students collect, record, and share observations. This includes the following:</p> <p>Record information (observations, thoughts, and ideas).</p> <p>Use and share pictures, drawings, and/or writings of observations.</p>	<p>SCI.SEP4.A.3-5 Students begin to use quantitative approaches to collect data and conduct multiple trials of qualitative observations. (When possible, digital tools should be used.) This includes the following:</p> <p>Represent data in tables and/or various graphical displays (bar</p>	<p>SCI.SEP4.A.m Students extend quantitative analysis to investigations, distinguishing between correlation and causation, and basic statistical techniques of data and error analysis. This includes the following:</p> <p>Construct, analyze, and/or interpret graphical displays of data and/or</p>	<p>SCI.SEP4.A.h Students engage in more detailed statistical analysis, the comparison of data sets for consistency, and the use of models to generate and analyze data. This includes the following:</p> <p>Analyze data using tools, technologies, and/or models (e.g.,</p>

	<p>Use observations (firsthand or from media) to describe patterns and/or relationships in the natural and designed world(s) in order to answer scientific questions and solve problems.</p> <p>Compare predictions (based on prior experiences) to what occurred (observable events).</p> <p>Analyze data from tests of an object or tool to determine if the object or tool works as intended.</p>	<p>graphs, pictographs, and/or pie charts) to reveal patterns that indicate relationships.</p> <p>Analyze and interpret data to make sense of phenomena, using logical reasoning, mathematics, and/or computation.</p> <p>Compare and contrast data collected by different groups in order to discuss similarities and differences in their findings.</p> <p>Analyze data to refine a problem statement or the design of a proposed object, tool, or process.</p> <p>Use data to evaluate and refine design solutions.</p>	<p>large data sets to identify linear and nonlinear relationships.</p> <p>Use graphical displays (e.g., maps, charts, graphs, and/or tables) of large data sets to identify temporal and spatial relationships.</p> <p>Distinguish between causal and correlational relationships in data.</p> <p>Analyze and interpret data to provide evidence for explanations of phenomena.</p> <p>Apply concepts of statistics and probability (including mean, median, mode, and variability) to analyze and characterize data, using digital tools when feasible.</p> <p>Consider limitations of data analysis (e.g., measurement error), and/or seek to improve precision and accuracy of data with better technological tools and methods (e.g., multiple trials).</p> <p>Analyze and interpret data to determine similarities and differences in findings.</p> <p>Analyze data to define an optimal operational range for a proposed object, tool, process, or system that best meets criteria for success.</p>	<p>computational, mathematical) in order to make valid and reliable scientific claims or determine an optimal design solution.</p> <p>Apply concepts of statistics and probability (including determining function fits to data, slope, intercept, and correlation coefficient for linear fits) to scientific and engineering questions and problems, using digital tools when feasible.</p> <p>Consider and address more sophisticated limitations of data analysis (e.g., sample selection) when analyzing and interpreting data</p> <p>Compare and contrast various types of data sets (e.g., self-generated, archival) to examine consistency of measurements and observations.</p> <p>Evaluate the impact of new data on a working explanation and/or model of a proposed process or system.</p> <p>Analyze data to identify design features or characteristics of the components of a proposed process or system to optimize it relative to criteria for success.</p>

Standard SCI.SEP5: Students use *mathematics and computational thinking*, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP5.A: Qualitative and Quantitative Data	<p>SCI.SEP5.A,B.K-2 Students recognize that mathematics can be used to describe the natural and designed world. This includes the following:</p> <p>Use counting and numbers to identify and describe patterns in the natural and designed world(s).</p> <p>Describe, measure, and/or compare quantitative attributes of different objects and display the data using simple graphs.</p> <p>Use quantitative data to compare two alternative solutions to a problem.</p>	<p>SCI.SEP5.A,B.3-5 Students extend quantitative measurements to a variety of physical properties, using computation and mathematics to analyze data and compare alternative design solutions. This includes the following:</p> <p>Organize simple data sets to reveal patterns that suggest relationships.</p> <p>Describe, measure, estimate, and/or graph quantities such as area, volume, weight, and time to address scientific and engineering questions and problems.</p> <p>Create and/or use graphs and/or charts generated from simple algorithms to compare alternative solutions to an engineering problem.</p>	<p>SCI.SEP5.A.m Students identify patterns in large data sets and use mathematical concepts to support explanations and arguments. This includes the following:</p> <p>Decide when to use qualitative vs. quantitative data.</p> <p>Use digital tools (e.g., computers) to analyze very large data sets for patterns and trends.</p> <p>Use mathematical representations to describe and/or support scientific conclusions and design solutions.</p> <p>Create algorithms (a series of ordered steps) to solve a problem.</p> <p>Apply mathematical concepts and/or processes (such as ratio, rate, percent, basic operations, and simple algebra) to scientific and engineering questions and problems.</p> <p>Use digital tools and/or mathematical concepts and arguments to test and compare proposed solutions to an engineering design problem.</p>	<p>SCI.SEP5.A.h Students use algebraic thinking and analysis, a range of linear and nonlinear functions (including trigonometric functions, exponentials, and logarithms), and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions. This includes the following:</p> <p>Decide if qualitative or quantitative data are best to determine whether a proposed object or tool meets criteria for success.</p> <p>Create and/or revise a computational model or simulation of a phenomenon, designed device, process, or system.</p> <p>Use mathematical, computational, and/or algorithmic representations of phenomena or design solutions to describe and/or support claims and/or explanations.</p> <p>Apply techniques of algebra and functions to represent and solve scientific and engineering problems.</p>

				<p>Use simple limit cases to test mathematical expressions, computer programs, algorithms, or simulations of a process or system to see if a model “makes sense” by comparing the outcomes with what is known about the real world.</p> <p>Apply ratios, rates, percentages, and unit conversions in the context of complicated measurement problems involving quantities with derived or compound units (such as mg/mL, kg/m³, acre-feet, and others).</p>
--	--	--	--	--

Standard SCI.SEP6: Students *construct explanations and design solutions*, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP6.A: Construct an Explanation	<p>SCI.SEP6.A,B, C.K-2 Students use evidence and ideas in constructing evidence-based accounts of natural phenomena. This includes the following:</p> <p>Use information from observations (firsthand and from media) to construct an evidence-based account for natural phenomena.</p>	<p>SCI.SEP6.A.3-5 Students use evidence to construct explanations that specify variables that describe and predict phenomena. This includes the following:</p> <p>Construct an explanation of observed relationships (e.g., the distribution of plants in the back yard).</p> <p>Use evidence (e.g., measurements, observations, patterns) to construct or support an explanation.</p> <p>Identify the evidence that supports particular points in an explanation.</p>	<p>SCI.SEP6.A.m Students construct explanations supported by multiple sources of evidence consistent with scientific ideas, principles, and theories. This includes the following:</p> <p>Construct an explanation that includes qualitative or quantitative relationships between variables that predict(s) and/or describe(s) phenomena.</p> <p>Construct an explanation using models or representations.</p> <p>Construct a scientific explanation based on valid and reliable evidence</p>	<p>SCI.SEP6.A.h Students create explanations that are supported by multiple and independent student-generated sources of evidence consistent with scientific ideas, principles, and theories. This includes the following:</p> <p>Make a quantitative and/or qualitative claim regarding the relationship between dependent and independent variables.</p> <p>Construct and revise an explanation based on valid and reliable evidence obtained from a variety of sources (including students’ own</p>

			<p>obtained from sources, including the students' own experiments, and built on the assumption that theories and laws that describe the natural world operate today as they did in the past and will continue to do so in the future.</p> <p>Apply scientific ideas, principles, and/or evidence to construct, revise, and/or use an explanation for real world phenomena, examples, or events.</p> <p>Apply scientific reasoning to show why the data or evidence is adequate for the explanation or conclusion.</p>	<p>investigations, models, theories, simulations, peer review), and the assumption that theories and laws that describe the natural world operate today as they did in the past and will continue to do so in the future.</p> <p>Apply scientific ideas, principles, and/or evidence to provide an explanation of phenomena taking into account possible, unanticipated effects.</p> <p>Apply scientific reasoning, theory, and/or models to link evidence to the claims to assess the extent to which the reasoning and data support the explanation or conclusion.</p>
SCI.SEP6.B: Design Solutions	<p>SCI.SEP6.B.K-2 Students use evidence and ideas in designing solutions. This includes the following:</p> <p>Use tools and/or materials to design and/or build a device that solves a specific problem or a solution to a specific problem.</p> <p>Generate and/or compare multiple solutions to a problem.</p>	<p>SCI.SEP6.B.3-5 Students use evidence in designing multiple solutions to design problems. This includes the following:</p> <p>Apply scientific ideas to solve design problems.</p> <p>Generate and compare multiple solutions to a problem based on how well they meet the criteria and constraints of the design solution.</p>	<p>SCI.SEP6.B.m Students design solutions supported by multiple sources of evidence consistent with scientific ideas, principles, and theories. This includes the following:</p> <p>Apply scientific ideas or principles to design, construct, and/or test a design of an object, tool, process, or system.</p> <p>Undertake a design project, engaging in the design cycle, to construct and/or implement a solution that meets specific design criteria and constraints.</p>	<p>SCI.SEP6.B.h Students create designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific ideas, principles, and theories. This includes the following:</p> <p>Design, evaluate, and/or refine a solution to a complex real-world problem, based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and considerations of trade-offs.</p> <p>Apply scientific ideas, principles,</p>

			Optimize performance of a design by prioritizing criteria, making trade-offs, testing, revising, and retesting.	and/or evidence to solve design problems, taking into account possible unanticipated effects.
Standard SCI.SEP7: Students <i>engage in argument from evidence</i>, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.				
Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP7.A: Argue from Evidence	<p>SCI.SEP7.A.K-2 Students compare ideas and representations about the natural and designed world. This includes the following:</p> <p>Identify arguments that are supported by evidence.</p> <p>Distinguish between explanations that account for all gathered evidence and those that do not.</p> <p>Analyze why some evidence is relevant to a scientific question and some is not.</p> <p>Distinguish between opinions and evidence in one's own explanations.</p> <p>Listen actively to arguments to indicate agreement or disagreement based on evidence, and/or to retell the main points of the argument.</p> <p>Construct an argument with evidence to support a claim.</p> <p>Make a claim about the effectiveness of an object, tool, or</p>	<p>SCI.SEP7.A.3-5 Students critique the scientific explanations or solutions proposed by peers by citing relevant evidence about the natural and designed world. This includes the following:</p> <p>Compare and refine arguments based on an evaluation of the evidence presented.</p> <p>Distinguish among facts, reasoned judgment based on research findings, and speculation in an explanation.</p> <p>Respectfully provide and receive critiques from peers about a proposed procedure, explanation, or model by citing relevant evidence and posing specific questions.</p> <p>Construct and/or support an argument with evidence, data, and/or a model.</p> <p>Use data to evaluate claims about cause and effect.</p> <p>Make a claim about the merit of a</p>	<p>SCI.SEP7.A.m Students construct a convincing argument that supports or refutes claims for either explanations or solutions about the natural and designed world. This includes the following.</p> <p>Compare and critique two arguments on the same topic and analyze whether they emphasize similar or different evidence and/or interpretations of facts.</p> <p>Respectfully provide and receive critiques about one's explanations, procedures, models, and questions by citing relevant evidence and posing and responding to questions that elicit pertinent elaboration and detail.</p> <p>Construct, use, and/or present an oral and written argument supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem.</p>	<p>SCI.SEP7.A.h Students use appropriate and sufficient evidence and scientific reasoning to defend and critique claims and explanations about the natural and designed world. Arguments may also come from current scientific or historical episodes in science. This includes the following:</p> <p>Compare and evaluate competing arguments or design solutions in light of currently accepted explanations, new evidence, limitations (e.g., trade-offs), constraints, and ethical issues.</p> <p>Evaluate the claims, evidence, and/or reasoning behind currently accepted explanations or solutions to determine the merits of arguments.</p> <p>Respectfully provide and/or receive critiques on scientific arguments by probing reasoning and evidence and challenging ideas and conclusions, responding thoughtfully to diverse perspectives, and determining what</p>

	solution that is supported by relevant evidence.	solution to a problem by citing relevant evidence about how it meets the criteria and constraints of the problem.	<p>Make an oral or written argument that supports or refutes the advertised performance of a device, process, or system, based on empirical evidence concerning whether or not the technology meets relevant criteria and constraints.</p> <p>Evaluate competing design solutions based on jointly developed and agreed-upon design criteria.</p>	<p>additional information is required to resolve contradictions.</p> <p>Construct, use, and/or present an oral and written argument or counter-arguments based on data and evidence.</p> <p>Make and defend a claim based on evidence about the natural world or the effectiveness of a design solution that reflects scientific knowledge and student-generated evidence.</p> <p>Evaluate competing design solutions to a real-world problem based on scientific ideas and principles, empirical evidence, and/or logical arguments regarding relevant factors (e.g. economic, societal, environmental, ethical considerations).</p>
--	--	---	---	---

Standard SCI.SEP8: Students will ***obtain, evaluate and communicate information***, in conjunction with using crosscutting concepts and disciplinary core ideas, to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.SEP8.A: Obtain, Evaluate, and Communicate Information	<p>SCI.SEP8.A.K-2 Students use observations and texts to communicate new information. LIFE SCIENCE

Standard SCI.LS1: Students use science and engineering practices, crosscutting concepts, and an understanding of **structures and processes** (on a scale from molecules to organisms) to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.LS1.A: Structure and Function	SCI.LS1.A.1 All organisms have external parts that they use to perform daily functions.	SCI.LS1.A.4 Plants and animals have both internal and external macroscopic structures that allow for growth, survival, behavior, and reproduction.	SCI.LS1.A.m All living things are made up of cells. In organisms, cells work together to form tissues and organs that are specialized for particular body functions.	SCI.LS1.A.h Systems of specialized cells within organisms help perform essential functions of life. Any one system in an organism is made up of numerous parts. Feedback mechanisms maintain an organism's internal conditions within certain limits and mediate behaviors.
SCI.LS1.B: Growth and Development of Organisms	SCI.LS1.B.1 Parents and offspring often engage in behaviors that help the offspring survive.	SCI.LS1.B.3 Reproduction is essential to every kind of organism. Organisms have unique and diverse life cycles.	SCI.LS1.B.m Animals engage in behaviors that increase the odds of reproduction. An organism's growth is affected by both genetic and environmental factors.	SCI.LS1.B.h Growth and division of cells in organisms occurs by mitosis and differentiation for specific cell types.
SCI.LS1.C: Organization for Matter and Energy Flow in Organisms	SCI.LS1.C.K Animals obtain food they need from plants or other animals. Plants need water and light.	SCI.LS1.C.5 Food provides animals with the materials and energy they need for body repair, growth, warmth, and motion. Plants acquire material for growth chiefly from air, water, and process matter, and obtain energy from sunlight, which is used to maintain conditions necessary for survival.	SCI.LS1.C.m Plants use the energy from light to make sugars through photosynthesis. Within individual organisms, food is broken down through a series of chemical reactions that rearrange molecules and release energy.	SCI.LS1.C.h The molecules produced through photosynthesis are used to make amino acids and other molecules that can be assembled into proteins or DNA. Through cellular respiration, matter and energy flow through different organizational levels of an organism as elements are recombined to form different products and transfer energy.
SCI.LS1.D: Information Processing	SCI.LS1.D.1 Animals sense and communicate information and respond to inputs with behaviors that help them grow	SCI.LS1.D.4 Different sense receptors are specialized for particular kinds of information; animals use their	SCI.LS1.D.m Each sense receptor responds to different inputs, transmitting them as signals, that travel along nerve	SCI.LS1.D.h Organisms can process and store a variety of information through specific chemicals and

	and survive.	perceptions and memories to guide their actions.	cells to the brain. The signals are then processed in the brain resulting in immediate behavior or memories.	interconnected networks.
SCI.LS1: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	<p>K-LS1-1. Use observations to describe patterns of what plants and animals (including humans) need to survive.</p> <p>1-LS1-1. Use materials to design a solution to a human problem by mimicking how plants and/or animals use their external parts to help them survive, grow, and meet their needs.</p> <p>1-LS1-2. Read texts and use media to determine patterns in behavior of parents and offspring that help offspring survive.</p>			
Grades 3-5	<p>3-LS1-1. Develop models to describe that organisms have unique and diverse life cycles, but all have in common birth, growth, reproduction, and death.</p> <p>4-LS1-1. Construct an argument that plants and animals have internal and external structures that function to support survival, growth, behavior, and reproduction.</p> <p>4-LS1-2. Use a model to describe that animals receive different types of information through their senses, process the information in their brain, and respond to the information in different ways.</p> <p>5-LS1-1. Support an argument that plants get the materials they need for growth chiefly from air and water.</p>			
Grades 6-8	<p>MS-LS1-1. Conduct an investigation to provide evidence that living things are made of cells, either one cell or many different numbers and types of cells.</p> <p>MS-LS1-2. Develop and use a model to describe the function of a cell as a whole and ways parts of cells contribute to the function.</p> <p>MS-LS1-3. Use argument supported by evidence for how the body is a system of interacting subsystems composed of groups of cells.</p> <p>MS-LS1-4. Use argument based on empirical evidence and scientific reasoning to support an explanation for how characteristic animal behaviors and specialized plant structures affect the probability of successful reproduction of animals and plants respectively.</p> <p>MS-LS1-5. Construct a scientific explanation based on evidence for how environmental and genetic factors influence the growth of organisms.</p> <p>MS-LS1-6. Construct a scientific explanation based on evidence for the role of photosynthesis in the cycling of matter and flow of energy into and out of organisms.</p> <p>MS-LS1-7. Develop a model to describe how food is rearranged through chemical reactions forming new molecules that support growth and/or release energy as this matter moves through an organism.</p> <p>MS-LS1-8. Gather and synthesize information that sensory receptors respond to stimuli by sending messages to the brain for immediate behavior or storage as memories.</p>			

Grades 9-12

HS-LS1-1. Construct an explanation based on evidence for how the structure of DNA determines the structure of proteins which carry out the essential functions of life through systems of specialized cells.

HS-LS1-2. Develop and use a model to illustrate the hierarchical organization of interacting systems that provide specific functions within multicellular organisms.

HS-LS1-3. Plan and conduct an investigation to provide evidence that feedback mechanisms maintain homeostasis.

HS-LS1-4. Use a model to illustrate the role of cellular division (mitosis) and differentiation in producing and maintaining complex organisms.

HS-LS1-5. Use a model to illustrate how photosynthesis transforms light energy into stored chemical energy.

HS-LS1-6. Construct and revise an explanation based on evidence for how carbon, hydrogen, and oxygen from sugar molecules may combine with other elements to form amino acids and/or other large carbon-based molecules.

HS-LS1-7. Use a model to illustrate that cellular respiration is a chemical process whereby the bonds of food molecules and oxygen molecules are broken and the bonds in new compounds are formed resulting in a net transfer of energy.

Standard SCI.LS2--Ecosystems: Students use science and engineering practices, crosscutting concepts, and an understanding of the *interactions, energy, and dynamics within ecosystems* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.LS2.A: Interdependent Relationships in Ecosystems	SCI.LS2.A.2 Plants depend on water and light to grow. Plants depend on animals for pollination or to move their seeds around.	SCI.LS2.A.5 The food of almost any animal can be traced back to plants. Organisms are related in food webs in which some animals eat plants for food and other animals eat the animals that eat plants, while decomposers restore some materials back to the soil.	SCI.LS2.A.m Organisms and populations are dependent on their environmental interactions both with other living things and with nonliving factors, any of which can limit their growth. Competitive, predatory, and mutually beneficial interactions vary across ecosystems but the patterns are shared.	SCI.LS2.A.h Ecosystems have carrying capacities resulting from biotic and abiotic factors. The fundamental tension between resource availability and organism populations affects the abundance of species in any given ecosystem. The combination of the factors that affect an organism's success can be measured as a multidimensional niche.
SCI.LS2.B: Cycles of Matter and Energy Transfer in Ecosystems		SCI.LS2.B.5 Matter cycles between the air and soil and among organisms as they live and die.	SCI.LS2.B.m The atoms that make up the organisms in an ecosystem are cycled repeatedly between the living and nonliving parts of the ecosystem. Food webs model how matter and energy are transferred among producers, consumers, and decomposers as the three groups interact within an ecosystem.	SCI.LS2.B.h Photosynthesis and cellular respiration provide most of the energy for life processes. Only a fraction of matter consumed at the lower level of a food web is transferred up, resulting in fewer organisms at higher levels. At each link in an ecosystem, elements are combined in different ways, and matter and energy are conserved. Photosynthesis and cellular respiration are key components of the global carbon cycle.
SCI.LS2.C: Ecosystem Dynamics, Functioning, and Resilience		SCI.LS2.C.3 When the environment changes, some organisms survive and reproduce, some move to new locations, some move into transformed environments, and some die.	SCI.LS2.C.m Ecosystem characteristics vary over time. Disruptions to any part of an ecosystem can lead to shifts in all of its populations. The completeness or integrity of an ecosystem's biodiversity is often used as a	SCI.LS2.C.h If a biological or physical disturbance to an ecosystem occurs, including one induced by human activity, the ecosystem may return to its more or less original state or become a very different ecosystem,

			measure of its health.	depending on the complex set of interactions within the ecosystem.
SCI.LS2.D: Social Interactions and Group Behavior		SCI.LS2.D.3 Being part of a group helps animals obtain food, defend themselves, and cope with changes.	SCI.LS2.D.m Changes in biodiversity can influence humans' resources, such as food, energy, and medicines, as well as ecosystem services that humans rely on -- for example, water purification and recycling.	SCI.LS2.D.h Group behavior has evolved because membership can increase the chances of survival for individuals and their genetic relatives.
SCI.LS2: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	2-LS2-1. Plan and conduct an investigation to determine if plants need sunlight and water to grow. 2-LS2-2. Develop a simple model that mimics the function of an animal in dispersing seeds or pollinating plants.			
Grades 3-5	3-LS2-1. Construct an argument that some animals form groups that help members survive. 5-LS2-1. Develop a model to describe the movement of matter among plants, animals, decomposers, and the environment.			
Grades 6-8	MS-LS2-1. Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem. MS-LS2-2. Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems. MS-LS2-3. Develop a model to describe the cycling of matter and flow of energy among living and nonliving parts of an ecosystem. MS-LS2-4. Construct an argument supported by empirical evidence that changes to physical or biological components of an ecosystem affect populations. MS-LS2-5. Evaluate competing design solutions for maintaining biodiversity and ecosystem services.			
Grades 9-12	HS-LS2-1. Use mathematical and/or computational representations to support explanations of factors that affect carrying capacity of ecosystems at different scales. HS-LS2-2. Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales. HS-LS2-3. Construct and revise an explanation based on evidence for the cycling of matter and flow of energy in aerobic and anaerobic conditions. HS-LS2-4. Use mathematical representations to support claims for the cycling of matter and flow of energy among organisms in an ecosystem HS-LS2-5. Develop a model to illustrate the role of photosynthesis and cellular respiration in the cycling of carbon among the biosphere, atmosphere, hydrosphere, and geosphere. HS-LS2-6. Evaluate the claims, evidence, and reasoning that the complex interactions in ecosystems maintain relatively consistent numbers and types of organisms in stable conditions, but changing conditions may result in a new ecosystem. HS-LS2-7. Design, evaluate, and refine a solution for reducing the impacts of human activities on the environment and biodiversity. HS-LS2-8. Evaluate the evidence for the role of group behavior on individual and species' chances to survive and reproduce.			

Standard SCI.LS3--Heredity: Students use science and engineering practices, crosscutting concepts, and an understanding of *heredity* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.LS3.A: Inheritance of Traits	SCI.LS3.A.1 Young organisms are very much, but not exactly, like their parents, and also resemble other organisms of the same kind.	SCI.LS3.A.3 Many characteristics of organisms are inherited from their parents. Other characteristics result from individuals' interactions with the environment. Many characteristics involve both inheritance and environment.	SCI.LS3.A.m Genes chiefly regulate a specific protein, which affect an individual's traits.	SCI.LS3.A.h DNA carries instructions for forming species' characteristics. Each cell in an organism has the same genetic content, but genes expressed by cells can differ.
SCI.LS3.B: Variation of Traits	SCI.LS3.B.1 Individuals of the same kind of plant or animal are recognizable as similar, but can also vary in many ways.	SCI.LS3.B.3 Different organisms vary in how they look and function because they have different inherited information; the environment also affects the traits that an organism develops.	SCI.LS3.B.m In sexual reproduction, each parent contributes half of the genes acquired by the offspring resulting in variation between parent and offspring. Genetic information can be altered because of mutations, which may result in beneficial, negative, or no change to proteins in or traits of an organism.	SCI.LS3.B.h The variation and distribution of traits in a population depend on genetic and environmental factors. Genetic variation can result from mutations caused by environmental factors or errors in DNA replication, or from chromosomes swapping sections during meiosis.

SCI.LS3: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS

Grades K-2	1-LS3-1. Make observations to construct an evidence-based account that young plants and animals are like, but not exactly like, their parents.
Grades 3-5	3-LS3-1. Analyze and interpret data to provide evidence that plants and animals have traits inherited from parents and that variation of these traits exists in a group of similar organisms. 3-LS3-2. Use evidence to support the explanation that traits can be influenced by the environment.
Grades 6-8	MS-LS3-1. Develop and use a model to describe why structural changes to genes (mutations) located on chromosomes may affect proteins and may result in harmful, beneficial, or neutral effects to the structure and function of the organism. MS-LS3-2. Develop and use a model to describe why asexual reproduction results in offspring with identical genetic information, and sexual reproduction results in offspring with genetic variation.

Grades 9-12

HS-LS3-1. Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring.

HS-LS3-2. Make and defend a claim based on evidence that inheritable genetic variations may result from: (1) new genetic combinations through meiosis, (2) viable errors occurring during replication, and/or (3) mutations caused by environmental factors.

HS-LS3-3. Apply concepts of statistics and probability to explain the variation and distribution of expressed traits in a population.

DRAFT

Standard SCI.LS4--Evolution: Students use science and engineering practices, crosscutting concepts, and an understanding of *biological evolution* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.LS4.A: Evidence of Common Ancestry and Diversity		SCI.LS4.A.3 Some living organisms resemble organisms that once lived on Earth. Fossils provide evidence about the types of organisms and environments that existed long ago.	SCI.LS4.A.m The fossil record documents the existence, diversity, extinction, and change of many life forms and their environments through Earth's history. The fossil record and comparisons of anatomical similarities between organisms enables the inference of lines of evolutionary descent.	SCI.LS4.A.h The ongoing branching that produces multiple lines of descent can be inferred by comparing DNA sequences, amino acid sequences, and anatomical and embryological evidence of different organisms.
SCI.LS4.B: Natural Selection		SCI.LS4.B.3 Differences in characteristics between individuals of the same species provide advantages in surviving and reproducing.	SCI.LS4.B.m Both natural and artificial selection result from certain traits giving some individuals an advantage in surviving and reproducing, leading to predominance of certain traits in a population.	SCI.LS4.B.h Natural selection occurs only if there is variation in the genes and traits between organisms in a population. Traits that positively affect survival can become more common in a population.
SCI.LS4.C: Adaptation		SCI.LS4.C.3 Particular organisms can only survive in particular environments.	SCI.LS4.C.m Species can change over time in response to changes in environmental conditions through adaptation by natural selection acting over generations. Traits that support successful survival and reproduction in the new environment become more common.	SCI.LS4.C.h Evolution results primarily from genetic variation of individuals in a species, competition for resources, and proliferation of organisms better able to survive and reproduce. Adaptation means that the distribution of traits in a population, as well as species expansion, emergence, or extinction, can change when conditions change.
SCI.LS4.D: Biodiversity and Humans	SCI.LS4.D.2 There are many different kinds of living things in any area, and they exist in different places on land and	SCI.LS4.D.3 Populations of organisms live in a variety of habitats. Change in those habitats affects the organisms living	SCI.LS4.D.m Changes in biodiversity can influence humans' resources and ecosystem services they rely on.	SCI.LS4.D.h Biodiversity is increased by formation of new species and reduced by extinction. Humans

	in water.	there.		depend on biodiversity but also have adverse impacts on it. Sustaining biodiversity is essential to supporting life on Earth.
SCI.LS4: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	2-LS4-1. Make observations of plants and animals to compare the diversity of life in different habitats.			
Grades 3-5	3-LS4-1. Analyze and interpret data from fossils to provide evidence of the organisms and the environments in which they lived long ago. 3-LS4-2. Use evidence to construct an explanation for how the variations in characteristics among individuals of the same species may provide advantages in surviving, finding mates, and reproducing. 3-LS4-3. Construct an argument with evidence that in a particular habitat some organisms can survive well, some survive less well, and some cannot survive at all. 3-LS4-4. Make a claim about the merit of a solution to a problem caused when the environment changes and the types of plants and animals that live there may change.			
Grades 6-8	MS-LS4-1. Analyze and interpret data for patterns in the fossil record that document the existence, diversity, extinction, and change of life forms throughout the history of life on Earth under the assumption that natural laws operate today as in the past. MS-LS4-2. Apply scientific ideas to construct an explanation for the anatomical similarities and differences among modern organisms and between modern and fossil organisms to infer evolutionary relationships. MS-LS4-3. Analyze displays of pictorial data to compare patterns of similarities in the embryological development across multiple species to identify relationships not evident in the fully formed anatomy. MS-LS4-4. Construct an explanation based on evidence that describes how genetic variations of traits in a population increase some individuals' probability of surviving and reproducing in a specific environment. MS-LS4-5. Gather and synthesize information about the technologies that have changed the way humans influence the inheritance of desired traits in organisms. MS-LS4-6. Use mathematical representations to support explanations of how natural selection may lead to increases and decreases of specific traits in populations over time.			
Grades 9-12	HS-LS4-1. Communicate scientific information that common ancestry and biological evolution are supported by multiple lines of empirical evidence. HS-LS4-2. Construct an explanation based on evidence that the process of evolution primarily results from four factors: (1) the potential for a species to increase in number, (2) the heritable genetic variation of individuals in a species due to mutation and sexual reproduction, (3) competition for limited resources, and (4) the proliferation of those organisms that are better able to survive and reproduce in the environment. HS-LS4-3. Apply concepts of statistics and probability to support explanations that organisms with an advantageous heritable trait tend to increase in proportion to organisms lacking this trait. HS-LS4-4. Construct an explanation based on evidence for how natural selection leads to adaptation of populations. HS-LS4-5. Evaluate the evidence supporting claims that changes in environmental conditions may result in: (1) increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species. HS-LS4-6. Create or revise a simulation to test a solution to mitigate adverse impacts of human activity on biodiversity.			

DRAFT

PHYSICAL SCIENCE

Standard SCI.PS1: Students use science and engineering practices, crosscutting concepts, and an understanding of *matter and its interactions* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.PS1.A: Structures and Properties of Matter	SCI.PS1.A.2 Matter exists as different substances that have different observable properties. Different properties are suited to different purposes. Objects can be built up from smaller parts.	SCI.PS1.A.5 Matter exists as particles that are too small to see. Matter is always conserved even if it seems to disappear. Measurements of a variety of observable properties can be used to identify particular materials.	SCI.PS1.A.m The fact that matter is composed of atoms and molecules can be used to explain the properties of substances, diversity of materials, states of matter, phase changes, and conservation of matter.	SCI.PS1.A.h The sub-atomic structural model and interactions between electric charges at the atomic scale can be used to explain the structure and interactions of matter, including chemical reactions and nuclear processes. Repeating patterns of the periodic table reflect patterns of outer electrons. A stable molecule has less energy than the same set of atoms separated; one must provide at least this energy to take the molecule apart.
SCI.PS1.B: Chemical Reactions	SCI.PS1.B.2 Heating or cooling a substance may cause changes that can be observed. Sometimes these changes are reversible, and sometimes they are not.	SCI.PS1.B.5 Chemical reactions that occur when substances are mixed can be identified by the emergence of substances with different properties. In chemical reactions the total mass remains the same. <i>Note: At this level, students are not expected to differentiate between mass and weight.</i>	SCI.PS1.B.m Reacting substances rearrange to form different molecules, but the number of atoms is conserved. Some reactions release energy and others absorb energy.	SCI.PS1.B.h Chemical processes are understood in terms of collisions of molecules, rearrangement of atoms, and changes in energy as determined by properties of elements involved.

SCI.PS1.C: Nuclear Processes	SCI.PS1.C	SCI.PS1.C	SCI.PS1.C.m	SCI.PS1.C.h Nuclear processes, including fusion, fission, and radioactive decays of unstable nuclei, involve release or absorption of energy.
SCI.PS1: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	2-PS1-1. Plan and conduct an investigation to describe and classify different kinds of materials by their observable properties. 2-PS1-2. Analyze data obtained from testing different materials to determine which materials have the properties that are best suited for an intended purpose. 2-PS1-3. Make observations to construct an evidence-based account of how an object made of a small set of pieces can be disassembled and made into a new object. 2-PS1-4. Construct an argument with evidence that some changes caused by heating or cooling can be reversed and some cannot.			
Grades 3-5	5-PS1-1. Develop a model to describe that matter is made of particles too small to be seen. 5-PS1-2. Measure and graph quantities to provide evidence that regardless of the type of change that occurs when heating, cooling, or mixing substances, the total weight of matter is conserved. 5-PS1-3. Make observations and measurements to identify materials based on their properties. 5-PS1-4. Conduct an investigation to determine whether the mixing of two or more substances results in new substances.			
Grades 6-8	MS-PS1-1. Develop models to describe the atomic composition of simple molecules and extended structures. MS-PS1-2. Analyze and interpret data on the properties of substances before and after the substances interact to determine if a chemical reaction has occurred. MS-PS1-3. Gather and make sense of information to describe that synthetic materials come from natural resources and impact society. MS-PS1-4. Develop a model that predicts and describes changes in particle motion, temperature, and state of a pure substance when thermal energy is added or removed. MS-PS1-5. Develop and use a model to describe how the total number of atoms does not change in a chemical reaction, and thus, mass is conserved. MS-PS1-6. Undertake a design project to construct, test, and modify a device that either releases or absorbs thermal energy by chemical processes.			
Grades 9-12	HS-PS1-1. Use the periodic table as a model to predict the relative properties of elements based on the patterns of electrons in the outermost energy level of atoms. HS-PS1-2. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties. HS-PS1-3. Plan and conduct an investigation to gather evidence to compare the structure of substances at the bulk scale to infer the strength of electrical forces between particles. HS-PS1-4. Develop a model to illustrate that the release or absorption of energy from a chemical reaction system depends upon the changes in total bond energy. HS-PS1-5. Apply scientific principles and evidence to provide an explanation about the effects of changing the temperature or concentration of the reacting particles on the rate at which a reaction occurs. HS-PS1-6. Refine the design of a chemical system by specifying a change in conditions that would produce increased amounts of products			

at equilibrium.

HS-PS1-7. Use mathematical representations to support the claim that atoms, and therefore mass, are conserved during a chemical reaction.

HS-PS1-8. Develop models to illustrate the changes in the composition of the nucleus of the atom and the energy released during the processes of fission, fusion, and radioactive decay.

DRAFT

Standard SCI.PS2: Students use science and engineering practices, crosscutting concepts, and an understanding of *forces, interactions, motion and stability* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.PS2.A: Forces and Motion	<p>SCI.PS2.A.K Pushes and pulls can have different strengths and directions, and can change the speed or direction of an object's motion, or start or stop it.</p> <p>A bigger push or pull makes things speed up or slow down more quickly.</p>	<p>SCI.PS2.A.3 Qualities of motion and changes in motion require description of both size and direction.</p> <p>The effect of unbalanced forces on an object results in a change of motion.</p> <p>Patterns of motion can be used to predict future motion.</p>	<p>SCI.PS2.A.m Motion and changes in motion can be qualitatively described using concepts of speed, velocity, and acceleration (including speeding up, slowing down, and/or changing direction).</p> <p>The role of the mass of an object must be qualitatively accounted for in any change of motion due to the application of a force (Newton's first and second law).</p> <p>For any pair of interacting objects, the force exerted by the first object on the second object is equal in strength to the force that the second object exerts on the first, but in the opposite direction (Newton's third law).</p>	<p>SCI.PS2.A.h Motion and changes in motion can be quantitatively described using concepts of speed, velocity, and acceleration (including speeding up, slowing down, and/or changing direction).</p> <p>Newton's second law of motion ($F=ma$) and the conservation of momentum can be used to predict changes in the motion of macroscopic objects.</p> <p>If a system interacts with objects outside itself, the total momentum of the system can change; however, any such change is balanced by changes in the momentum of objects outside the system.</p>
SCI.PS2.B: Types of Interactions	<p>SCI.PS2.B.K When objects touch or collide, they push on one another and can result in a change of motion.</p>	<p>SCI.PS2.B.3 Some forces act through contact, some forces (e.g. magnetic, electrostatic) act even when the objects are not in contact.</p> <p>SCI.PS2.B.5 The gravitational force of Earth acting on an object near Earth's</p>	<p>SCI.PS2.B.m Forces that act at a distance involve fields that can be mapped by their relative strength and effect on an object</p>	<p>SCI.PS2.B.h Forces at a distance are explained by fields that can transfer energy and can be described in terms of the arrangement and properties of the interacting objects and the distance between them. These forces can be used to describe the relationship between electrical and magnetic fields.</p> <p>Attraction and repulsion between electric charges at the atomic scale explain the structure, properties, and transformations of matter, as well as the contact forces between material objects.</p>

		surface pulls that object toward the planet's center.		
SCI.PS2: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	<p>K-PS2-1. Plan and conduct an investigation to compare the effects of different strengths or different directions of pushes and pulls on the motion of an object.</p> <p>K-PS2-2. Analyze data to determine if a design solution works as intended to change the speed or direction of an object with a push or a pull.</p>			
Grades 3-5	<p>3-PS2-1. Plan and conduct an investigation to provide evidence of the effects of balanced and unbalanced forces on the motion of an object.</p> <p>3-PS2-2. Make observations and/or measurements of an object's motion to provide evidence that a pattern can be used to predict future motion.</p> <p>3-PS2-3. Ask questions to determine cause and effect relationships of electric or magnetic interactions between two objects not in contact with each other.</p> <p>3-PS2-4. Define a simple design problem that can be solved by applying scientific ideas about magnets.</p> <p>5-PS2-1. Support an argument that the gravitational force exerted by Earth on objects is directed down.</p>			
Grades 6-8	<p>MS-PS2-1. Apply Newton's third law to design a solution to a problem involving the motion of two colliding objects.</p> <p>MS-PS2-2. Plan an investigation to provide evidence that the change in an object's motion depends on the sum of the forces on the object and the mass of the object.</p> <p>MS-PS2-3. Ask questions about data to determine the factors that affect the strength of electric and magnetic forces.</p> <p>MS-PS2-4. Construct and present arguments using evidence to support the claim that gravitational interactions are attractive and depend on the masses of interacting objects.</p> <p>MS-PS2-5. Conduct an investigation and evaluate the experimental design to provide evidence that fields exist between objects exerting forces on each other even though the objects are not in contact.</p>			
Grades 9-12	<p>HS-PS2-1. Analyze data to support the claim that Newton's second law of motion describes the mathematical relationship among the net force on a macroscopic object, its mass, and its acceleration.</p> <p>HS-PS2-2. Use mathematical representations (qualitative and quantitative) to support the claim that the total momentum of a system of objects is conserved when there is no net force on the system.</p> <p>HS-PS2-3. Apply scientific and engineering ideas to design, evaluate, and refine a device that minimizes the force on a macroscopic object during a collision.</p> <p>HS-PS2-4. Use mathematical representations (qualitative and quantitative) of Newton's law of gravitation and Coulomb's law to describe and predict the gravitational and electrostatic forces between objects.</p> <p>HS-PS2-5. Plan and conduct an investigation to provide evidence that an electric current can produce a magnetic field and that a changing magnetic field can produce an electric current.</p> <p>HS-PS2-6. Communicate scientific and technical information about why the molecular-level structure is important in the functioning of designed materials.</p>			

Standard SCI.PS3: Students use science and engineering practices, crosscutting concepts, and an understanding of **energy** to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.PS3.A: Definitions of Energy		SCI.PS3.A.4 Moving objects contain energy. The faster the object moves, the more energy it has.	SCI.PS3.A.m Kinetic energy can be distinguished from the various forms of potential energy.	SCI.PS3.A.h Systems move towards more stable states.
SCI.PS3.B: Conservation of Energy and Energy Transfer		SCI.PS3.B.4 Energy can be moved from place to place by moving objects, or through sound, light, or electrical currents. Energy can be converted from one form to another form.	SCI.PS3.B.m Energy changes to and from each type can be tracked through physical or chemical interactions. The relationship between the temperature and the total energy of a system depends on the types, states, and amounts of matter.	SCI.PS3.B.h The total energy within a system is conserved. Energy transfer within and between systems can be described and predicted in terms of energy associated with the motion or configuration of particles (objects).
SCI.PS3.C: Relationships Between Energy and Forces	SCI.PS3.C.K Bigger pushes and pulls cause bigger changes in an object's motion or shape.	SCI.PS3.C.4 When objects collide, contact forces transfer energy so as to change objects' motions.	SCI.PS3.C.m When two objects interact, each one exerts a force on the other, and these forces can transfer energy between the interacting objects.	SCI.PS3.C.h Fields contain energy that depends on the arrangement of the objects in the field.
SCI.PS3.D: Energy in Chemical Processes and Everyday Life	SCI.PS3.D.K Sunlight warms Earth's surface.	SCI.PS3.D.4, 5 Plants capture energy from sunlight which can be used as fuel or food. Stored energy in food or fuel can be converted to useable energy.	SCI.PS3.D.m Sunlight is captured by plants and used in a chemical reaction to produce sugar molecules for storing this energy. This stored energy can be released by respiration or combustion, which can be reversed by burning those molecules to release energy.	SCI.PS3.D.h Photosynthesis is the primary biological means of capturing radiation from the sun; energy cannot be destroyed, but it can be converted to less useful forms.

SCI.PS3: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	K-PS3-1. Make observations to determine the effect of sunlight on Earth's surface. K-PS3-2. Use tools and materials to design and build a structure that will reduce the warming effect of sunlight on an area.			
Grades 3-5	4-PS3-1. Use evidence to construct an explanation relating the speed of an object to the energy of that object. 4-PS3-2. Make observations to provide evidence that energy can be transferred from place to place by sound, light, heat, and electric currents. 4-PS3-3. Ask questions and predict outcomes about the changes in energy that occur when objects collide. 4-PS3-4. Apply scientific ideas to design, test, and refine a device that converts energy from one form to another. 5-PS3-1. Use models to describe that energy in animals' food (used for body repair, growth, motion, and to maintain body warmth) was once energy from the sun.			
Grades 6-8	MS-PS3-1. Construct and interpret graphical displays of data to describe the relationships of kinetic energy to the mass of an object and to the speed of an object (emphasis on qualitative descriptions of relationships). MS-PS3-2. Develop a model to describe that when the distance between two objects changes, different amounts of potential energy are stored in the system (e.g. gravitational, magnetic or electrostatic potential energy). MS-PS3-3. Apply scientific principles to design, construct, and test a device that either minimizes or maximizes thermal energy transfer. MS-PS3-4. Plan an investigation to determine the relationships among the energy transferred, the type of matter, the mass, and the change in the average kinetic energy of the particles as measured by the temperature of the sample. MS-PS3-5. Construct, use, and present arguments to support the claim that when the kinetic energy of an object changes, energy is transferred to or from the object.			
Grades 9-12	HS-PS3-1. Create a computational model to calculate the change in the energy of one component in a system when the change in energy of the other component(s) and energy flows in and out of the system are known. HS-PS3-2. Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative position of particles (objects). HS-PS3-3. Design, build, and refine a device that works within given constraints to convert one form of energy into another form of energy. HS-PS3-4. Plan and conduct an investigation to provide evidence that the transfer of thermal energy when two components of different temperature are combined within a closed system results in a more uniform energy distribution among the components in the system (second law of thermodynamics). HS-PS3-5. Develop and use a model of two objects interacting through electric or magnetic fields to illustrate the forces between objects and the changes in energy of the objects due to the interaction.			

Standard SCI.PS4: Students use science and engineering practices, crosscutting concepts, and an understanding of *waves and their applications in technologies for information transfer* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.PS4.A: Wave Properties	SCI.PS4.A.1 Sound can make matter vibrate, and vibrating matter can make sound.	SCI.PS4.A.4 Waves are regular patterns of motion, which can be made in water by disturbing the surface. Waves of the same type can differ in amplitude and wavelength. Waves can make objects move.	SCI.PS4.A.m A simple wave model has a repeating pattern with a specific wavelength, frequency, and amplitude, and mechanical waves need a medium through which they are transmitted. This model can explain many phenomena including sound and light. Waves can transmit energy.	SCI.PS4.A.h The wavelength and frequency of a wave are related to one another by the speed of the wave, which depends on the type of wave and the medium through which it is passing. Waves can be used to transmit information and energy.
SCI.PS4.B: Electromagnetic Radiation	SCI.PS4.B.1 Objects can be seen only when light is available to illuminate them.	SCI.PS4.B.4 Objects can be seen when light reflected from their surface enters our eyes.	SCI.PS4.B.m The construct of a wave is used to model how light interacts with objects.	SCI.PS4.B.h Both an electromagnetic wave model and a photon model explain features of electromagnetic radiation broadly and describe common applications of electromagnetic radiation.
SCI.PS4.C: Information Technologies and Instrumentation	SCI.PS4.C.1 People use devices to send and receive information.	SCI.PS4.C.4 Patterns can encode, send, receive, and decode information.	SCI.PS4.C.m Waves can be used to transmit digital information. Digitized information is comprised of a pattern of 1s and 0s.	SCI.PS4.C.h Large amounts of information can be stored and shipped around as a result of being digitized.

SCI.PS4: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS

Grades K-2	<p>1-PS4-1. Plan and conduct investigations to provide evidence that vibrating materials can make sound and that sound can make materials vibrate.</p> <p>1-PS4-2. Make observations to construct an evidence-based account that objects can be seen only when illuminated.</p> <p>1-PS4-3. Plan and conduct an investigation to determine the effect of placing objects made with different materials in the path of a beam of light.</p> <p>1-PS4-4. Use tools and materials to design and build a device that uses light or sound to solve the problem of communicating over a distance.</p>
-------------------	---

Grades 3-5	<p>4-PS4-1. Develop a model of waves to describe patterns in terms of amplitude and wavelength and that waves can cause objects to move.</p> <p>4-PS4-2. Develop a model to describe that light reflecting from objects and entering the eye allows objects to be seen.</p> <p>4-PS4-3. Generate and compare multiple solutions that use patterns to transfer information.</p>
Grades 6-8	<p>MS-PS4-1. Use mathematical representations to describe a simple model for waves that includes how the amplitude of a wave is related to the energy in a wave.</p> <p>MS-PS4-2. Develop and use a model to describe that waves are reflected, absorbed, or transmitted through various materials.</p> <p>MS-PS4-3. Integrate qualitative scientific and technical information to support the claim that digitized signals are a more reliable way to encode and transmit information than analog signals.</p>
Grades 9-12	<p>HS-PS4-1. Use mathematical representations to support a claim regarding relationships among the frequency, wavelength, and speed of waves traveling in various media.</p> <p>HS-PS4-2. Evaluate questions about the advantages of using a digital transmission and storage of information.</p> <p>HS-PS4-3. Evaluate the claims, evidence, and reasoning behind the idea that electromagnetic radiation can be described either by a wave model or a particle model, and that for some situations one model is more useful than the other.</p> <p>HS-PS4-4. Evaluate the validity and reliability of claims in published materials of the effects that different frequencies of electromagnetic radiation have when absorbed by matter.</p> <p>HS-PS4-5. Communicate technical information about how some technological devices use the principles of wave behavior and wave interactions with matter to transmit and capture information and energy.</p>

Content Area: EARTH AND SPACE SCIENCE

Standard SCI.ESS1: Students use science and engineering practices, crosscutting concepts, and an understanding of *Earth's place in the universe* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.ESS1.A: The Universe and Its Stars	SCI.ESS1.A.1 Patterns of movement of the sun, moon, and stars, as seen from Earth, can be observed, described, and predicted.	SCI.ESS1.A.5 Stars range greatly in size and distance from Earth, and this can explain their relative brightness	SCI.ESS1.A.m The solar system is part of the Milky Way, which is one of many billions of galaxies.	SCI.ESS1.A.h Light spectra from stars are used to determine their characteristics, processes, and lifecycles. Solar activity creates the elements through nuclear fusion. The development of technologies has provided the astronomical data that provide the empirical evidence for the Big Bang theory.
SCI.ESS1.B: Earth and the Solar System	SCI.ESS1.B.1 Seasonal patterns of sunrise and sunset can be observed, described, and predicted.	SCI.ESS1.B.5 The Earth's orbit and rotation, and the orbit of the moon around the Earth cause observable patterns.	SCI.ESS1.B.m The solar system contains many varied objects held together by gravity. Solar system models explain and predict eclipses, lunar phases, and seasons.	SCI.ESS1.B.h Kepler's laws describe common features of the motions of orbiting objects. Observations from astronomy and space probes provide evidence for explanations of solar system formation. Cyclical changes in Earth's tilt and orbit, occurring over tens to hundreds of thousands of years, cause cycles of ice ages and other gradual climate changes.
SCI.ESS1.C: The History of Planet Earth	SCI.ESS1.C.2 Some events on Earth occur very quickly; others can occur very slowly.	SCI.ESS1.C.4 Certain features on Earth can be used to order events that have occurred in a landscape.	SCI.ESS1.C.m Rock strata and the fossil record can be used as evidence to organize the relative occurrence of major historical events in Earth's history.	SCI.ESS1.C.h The rock record resulting from tectonic and other geoscience processes as well as objects from the solar system can provide evidence of Earth's early history and the relative ages of major geologic formations.
SCI.ESS1: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	1-ESS1-1. Use observations of the sun, moon, and stars to describe patterns that can be predicted. 1-ESS1-2. Make observations at different times of year to relate the amount of daylight to the time of year. 2-ESS1-1. Use information from several sources to provide evidence that Earth events can occur quickly or slowly.			

Grades 3-5	<p>4-ESS1-1. Identify evidence from patterns in rock formations and fossils in rock layers to support an explanation for changes in a landscape over time.</p> <p>5-ESS1-1. Support an argument that differences in the apparent brightness of the sun compared to other stars is due to their relative distances from Earth.</p> <p>5-ESS1-2. Represent data in graphical displays to reveal patterns of daily changes in length and direction of shadows, day and night, and the seasonal appearance of some stars in the night sky.</p>
Grades 6-8	<p>MS-ESS1-1. Develop and use a model of the Earth-sun-moon system to describe the cyclic patterns of lunar phases, eclipses of the sun and moon, and seasons.</p> <p>MS-ESS1-2. Develop and use a model to describe the role of gravity in the motions within galaxies and the solar system.</p> <p>MS-ESS1-3. Analyze and interpret data to determine scale properties of objects in the solar system.</p> <p>MS-ESS1-4. Construct a scientific explanation based on evidence from rock strata for how the geologic time scale is used to organize Earth's 4.6-billion-year-old history.</p>
Grades 9-12	<p>HS-ESS1-1. Develop a model based on evidence to illustrate the life span of the sun and the role of nuclear fusion in the sun's core to release energy that eventually reaches Earth in the form of radiation.</p> <p>HS-ESS1-2. Construct an explanation of the Big Bang theory based on astronomical evidence of light spectra, motion of distant galaxies, and composition of matter in the universe.</p> <p>HS-ESS1-3. Communicate scientific ideas about the way stars, over their life cycle, produce elements.</p> <p>HS-ESS1-4. Use mathematical or computational representations to predict the motion of orbiting objects in the solar system.</p> <p>HS-ESS1-5. Evaluate evidence of the past and current movements of continental and oceanic crust and the theory of plate tectonics to explain the ages of crustal rocks.</p> <p>HS-ESS1-6. Apply scientific reasoning and evidence from ancient Earth materials, meteorites, and other planetary surfaces to construct an account of Earth's formation and early history.</p>

Standard SCI.ESS2: Students use science and engineering practices, crosscutting concepts, and an understanding of *Earth's systems* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.ESS2.A: Earth Materials and Systems	SCI.ESS2.A.2 Wind and water change the shape of the land.	SCI.ESS2.A.4,5 Four major Earth systems interact. Rainfall helps to shape the land and affects the types of living things found in a region. Water, ice, wind, organisms, and gravity break rocks, soils, and sediments into smaller pieces and move them around.	SCI.ESS2.A.m Energy flows and matter cycles within and among Earth's systems, including the sun and Earth's interior as primary energy sources. Plate tectonics is one result of these processes.	SCI.ESS2.A.h Feedback effects exist within and among Earth's systems.
SCI.ESS2.B: Plate Tectonics and Large-Scale System Interactions	SCI.ESS2.B.2 Maps show where things are located. One can map the shapes and kinds of land and water in any area.	SCI.ESS2.B.4 Earth's physical features occur in patterns, as do earthquakes and volcanoes. Maps can be used to locate features and determine patterns in those events.	SCI.ESS2.B.m Plate tectonics is the unifying theory that explains movements of rocks at Earth's surface and geological history. Maps are used to display evidence of plate movement.	SCI.ESS2.B.h Radioactive decay within Earth's interior contributes to thermal convection in the mantle.
SCI.ESS2.C: The Roles of Water in Earth's Surface Processes	SCI.ESS2.C.2 Water is found in many types of places and in different forms on Earth.	SCI.ESS2.C.5 Most of Earth's water is in the ocean, and much of the Earth's freshwater is in glaciers or underground.	SCI.ESS2.C.m Water cycles among land, ocean, and atmosphere, and is propelled by sunlight and gravity. Density variations of sea water drive interconnected ocean currents. Water movement causes weathering and erosion, changing landscape features.	SCI.ESS2.C.h The planet's dynamics are greatly influenced by water's unique chemical and physical properties.

SCI.ESS2.D: Weather and Climate	SCI.ESS2.D.K Weather is the combination of sunlight, wind, snow or rain, and temperature in a particular region and time. People record weather patterns over time.	SCI.ESS2.D.3 Climate describes patterns of typical weather conditions over different scales and variations. Historical weather patterns can be analyzed.	SCI.ESS2.D.m Complex interactions determine local weather patterns and influence climate, including the role of the ocean.	SCI.ESS2.D.h The role of radiation from the sun and its interactions with the atmosphere, ocean, and land are the foundation for the global climate system. Global climate models are used to predict future changes, including changes influenced by human behavior and natural factors.
SCI.ESS2.E: Biogeology	SCI.ESS2.E.K Plants and animals can change their local environment.	SCI.ESS2.E.4 Living things can affect the physical characteristics of their environment.	SCI.ESS2.E.m The fossil record documents the existence, diversity, extinction, and change of many life forms throughout history (linked to content in LS4.A).	SCI.ESS2.E.h The biosphere and Earth's other systems have many interconnections that cause a continual coevolution of Earth's surface and life on it.
SCI.ESS2: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	K-ESS2-1. Use and share observations of local weather conditions to describe patterns over time. K-ESS2-2. Construct an argument supported by evidence for how plants and animals (including humans) can change the environment to meet their needs. 2-ESS2-1. Compare multiple solutions designed to slow or prevent wind or water from changing the shape of the land. 2-ESS2-2. Develop a model to represent the shapes and kinds of land and bodies of water in an area. 2-ESS2-3. Obtain information to identify where water is found on Earth, and that it can be solid or liquid.			
Grades 3-5	3-ESS2-1. Represent data in tables and graphical displays to describe typical weather conditions expected during a particular season. 3-ESS2-2. Obtain and combine information to describe climates in different regions of the world. 4-ESS2-1. Make observations and/or measurements to provide evidence of the effects of weathering or the rate of erosion by water, ice, wind, or vegetation. 4-ESS2-2. Analyze and interpret data from maps to describe patterns of Earth's features. 5-ESS2-1. Develop a model using an example to describe ways the geosphere, biosphere, hydrosphere, and/or atmosphere interact. 5-ESS2-2. Describe and graph the amounts and percentages of water and fresh water in various reservoirs to provide evidence about the distribution of water on Earth.			
Grades 6-8	MS-ESS2-1. Develop a model to describe the cycling of Earth's materials and the flow of energy that drives plate tectonics. MS-ESS2-2. Construct an explanation based on evidence for how geoscience processes have changed Earth's surface at varying time and spatial scales. MS-ESS2-3. Analyze and interpret data on the distribution of fossils and rocks, continental shapes, and seafloor structures to provide			

	<p>evidence of the past plate motions.</p> <p>MS-ESS2-4. Develop a model to describe the cycling of water through Earth's systems driven by energy from the sun and the force of gravity.</p> <p>MS-ESS2-5. Collect data to provide evidence for how the motions and complex interactions of air masses results in changes in weather conditions.</p> <p>MS-ESS2-6. Develop and use a model to describe how unequal heating and rotation of the Earth cause patterns of atmospheric and oceanic circulation that determine regional climates</p>
Grades 9-12	<p>HS-ESS2-1. Develop a model to illustrate how Earth's internal and surface processes operate at different spatial and temporal scales to form continental and ocean-floor features.</p> <p>HS-ESS2-2. Analyze geoscience data to make the claim that one change to Earth's surface can create feedbacks that cause changes to other Earth systems.</p> <p>HS-ESS2-3. Develop a model based on evidence of Earth's interior to describe the cycling of matter by thermal convection.</p> <p>HS-ESS2-4. Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.</p> <p>HS-ESS2-5. Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes.</p> <p>HS-ESS2-6. Develop a quantitative model to describe the cycling of carbon among the hydrosphere, atmosphere, geosphere, and biosphere.</p> <p>HS-ESS2-7. Construct an argument based on evidence about the simultaneous coevolution of Earth's systems and life on Earth.</p>

Standard SCI.ESS3: Students use science and engineering practices, crosscutting concepts, and an understanding of the *Earth and human activity* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.ESS3.A: Natural Resources	SCI.ESS3.A.K Living things need water, air, and resources from the land, and they live in places that have the things they need. Humans use natural resources for everything they do.	SCI.ESS3.A.4 Energy and fuels humans use are derived from natural sources, and their use affects the environment. Some resources are renewable over time, others are not.	SCI.ESS3.A.m Humans depend on Earth's land, oceans, fresh water, atmosphere, and biosphere for different resources, many of which are limited or not renewable. Resources are distributed unevenly around the planet as a result of past geologic processes.	SCI.ESS3.A.h Resource availability has guided the development of human society and use of natural resources has associated costs, risks, and benefits.
SCI.ESS3.B: Natural Hazards	SCI.ESS3.B.K In a region, some kinds of severe weather are more likely than others. Forecasts allow communities to prepare for severe weather.	SCI.ESS3.B.3,4 A variety of hazards result from natural processes; humans cannot eliminate hazards but can reduce their impacts.	SCI.ESS3.B.m Patterns can be seen through mapping the history of natural hazards in a region and understanding related geological forces.	SCI.ESS3.B.h Natural hazards and other geological events have shaped the course of human history at local, regional, and global scales.
SCI.ESS3.C: Human Impacts on Earth Systems	SCI.ESS3.C.K Things people do can affect the environment but they can make choices to reduce their impacts.	SCI.ESS3.C.5 Societal activities have had major effects on the land, ocean, atmosphere, and even outer space. Societal activities can also help protect Earth's resources and environments.	SCI.ESS3.C.m Human activities have altered the hydrosphere, atmosphere, and lithosphere which in turn has altered the biosphere. Changes to the biosphere can have different impacts for different living things. Activities and technologies can be engineered to reduce people's impacts on Earth.	SCI.ESS3.C.h Sustainability of human societies and the biodiversity that supports them requires responsible management of natural resources, including the development of technologies.
SCI.ESS3.D: Global Climate Change			SCI.ESS3.D.m Evidence suggests human activities affect global warming. Decisions to reduce the impact of global warming depend on	SCI.ESS3.D.h Global climate models used to predict changes continue to be improved, although discoveries about the global climate system are ongoing and continually needed.

			understanding climate science, engineering capabilities, and social dynamics.	
SCI.ESS3: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	<p>K-ESS3-1. Use a model to represent the relationship between the needs of different plants or animals (including humans) and the places they live.</p> <p>K-ESS3-2. Ask questions to obtain information about the purpose of weather forecasting to prepare for, and respond to, severe weather.</p> <p>K-ESS3-3. Communicate solutions that will reduce the impact of humans on the land, water, air, and/or other living things in the local environment.</p>			
Grades 3-5	<p>3-ESS3-1. Make a claim about the merit of a design solution that reduces the impacts of a weather-related hazard.</p> <p>4-ESS3-1. Obtain and combine information to describe that energy and fuels are derived from natural resources and their uses affect the environment.</p> <p>4-ESS3-2. Generate and compare multiple solutions to reduce the impacts of natural Earth processes on humans.</p> <p>5-ESS3-1. Obtain and combine information about ways individual communities use science ideas to protect the Earth's resources and environment.</p>			
Grades 6-8	<p>MS-ESS3-1. Construct a scientific explanation based on evidence for how the uneven distributions of Earth's mineral, energy, and groundwater resources are the result of past and current geoscience processes.</p> <p>MS-ESS3-2. Analyze and interpret data on natural hazards to forecast future catastrophic events and inform the development of technologies to mitigate their effects.</p> <p>MS-ESS3-3. Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.</p> <p>MS-ESS3-4. Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth's systems.</p> <p>MS-ESS3-5. Ask questions to clarify evidence of the factors that have caused the rise in global temperatures over the past century.</p>			
Grades 9-12	<p>HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity.</p> <p>HS-ESS3-2. Evaluate competing design solutions for developing, managing, and utilizing energy and mineral resources based on cost-benefit ratios.</p> <p>HS-ESS3-3. Create a computational simulation to illustrate the relationships among management of natural resources, the sustainability of human populations, and biodiversity.</p> <p>HS-ESS3-4. Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.</p> <p>HS-ESS3-5. Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems.</p> <p>HS-ESS3-6. Use a computational representation to illustrate the relationships among Earth systems and how those relationships are being modified due to human activity.</p>			

Content Area: ENGINEERING, TECHNOLOGY, AND THE APPLICATION OF SCIENCE

Standard: SCI.ETS1: Students use science and engineering practices, crosscutting concepts, and an understanding of *engineering design* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.ETS1.A: Defining and Delimiting Engineering Problems	<p>SCI.ETS1.A.K-2 A situation that people want to change or create can be approached as a problem to be solved through engineering.</p> <p>Asking questions, making observations, and gathering information are helpful in thinking about problems.</p> <p>Before beginning to design a solution, it is important to clearly understand the problem.</p>	<p>SCI.ETS1.A.3-5 Possible solutions to a problem are limited by available materials and resources (constraints). The success of a designed solution is determined by considering the desired features of a solution (criteria). Different proposals for solutions can be compared on the basis of how well each one meets the specified criteria for success or how well each takes the constraints into account.</p>	<p>SCI.ETS1.A.m The more precisely a design task's criteria and constraints can be defined, the more likely it is that the designed solution will be successful. Specification of constraints includes consideration of scientific principles and other relevant knowledge that are likely to limit possible solutions.</p>	<p>SCI.ETS1.A.h Criteria and constraints also include satisfying any requirements set by society, such as taking issues of risk mitigation into account, and they should be quantified to the extent possible and stated in such a way that one can tell if a given design meets them.</p> <p>Humanity faces major global challenges today, such as the need for supplies of clean water and food or for energy sources that minimize pollution, which can be addressed through engineering. These global challenges also may have manifestations in local communities.</p>
SCI.ETS1.B: Developing Possible Solutions	<p>SCI.ETS1.B.K-2 Designs can be conveyed through sketches, drawings, or physical models. These representations are useful in communicating ideas for a problem's</p>	<p>SCI.ETS1.B.3-5 Research on a problem should be carried out before beginning to design a solution. Testing a solution involves investigating how well it performs under a range of likely</p>	<p>SCI.ETS1.B.m A solution needs to be tested and then modified on the basis of the test results in order to improve it.</p> <p>There are systematic processes for evaluating solutions with respect to how well they meet the criteria and constraints of a</p>	<p>SCI.ETS1.B.h When evaluating solutions, it is important to take into account a range of constraints, including cost, safety, reliability, and aesthetics, and to consider social, cultural, and environmental impacts.</p> <p>Both physical models and computers can be used in various ways to aid in the engineering design process. Computers are useful for a variety of purposes, such</p>

	solutions to other people.	<p>conditions.</p> <p>At whatever stage, communicating with peers about proposed solutions is an important part of the design process, and shared ideas can lead to improved designs.</p> <p>Tests are often designed to identify failure points or difficulties, which suggest the elements of the design that need to be improved.</p>	<p>problem.</p> <p>Sometimes parts of different solutions can be combined to create a solution that is better than any of its predecessors.</p> <p>Models of all kinds are important for testing solutions.</p>	as running simulations to test different ways of solving a problem or to see which one is most efficient or economical. They are also useful in making a persuasive presentation to a client about how a given design will meet his or her needs.
SCI.ETS1.C: Optimizing the Design Solution	SCI.ETS1.C.K-2 Because there is more than one possible solution to a problem, it is useful to compare and test designs.	SCI.ETS1.C.3-5 Different solutions need to be tested in order to determine which of them best solves the problem, given the criteria and the constraints.	<p>SCI.ETS1.C.m Although one design may not perform the best across all tests, identifying the characteristics of the design that performed the best in each test can provide useful information for the redesign process—that is, some of those characteristics may be incorporated into the new design.</p> <p>The iterative process of testing the most promising solutions and modifying what is proposed on the basis of the test results leads to greater refinement and ultimately to an optimal solution.</p>	SCI.ETS1.C.h Criteria may need to be broken down into simpler ones that can be approached systematically, and decisions about the priority of certain criteria over others (trade-offs) may be needed.
SCI.ETS1: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	K-2-ETS1-1. Ask questions, make observations, and gather information about a situation people want to change to define a simple problem that can be solved through the development of a new or improved object or tool.			

	<p>K-2-ETS1-2. Develop a simple sketch, drawing, or physical model to illustrate how the shape of an object helps it function as needed to solve a given problem.</p> <p>K-2-ETS1-3. Analyze data from tests of two objects designed to solve the same problem to compare the strengths and weaknesses of how each performs.</p>
Grades 3-5	<p>3-5-ETS1-1. Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time, or cost.</p> <p>3-5-ETS1-2. Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.</p> <p>3-5-ETS1-2. Plan and carry out fair tests in which variables are controlled and failure points are considered to identify aspects of a model or prototype that can be improved.</p>
Grades 6-8	<p>MS-ETS1-1. Define the criteria and constraints of a design problem with sufficient precision to ensure a successful solution, taking into account relevant scientific principles and potential impacts on people and the natural environment that may limit possible solutions.</p> <p>MS-ETS1-2. Evaluate competing design solutions using a systematic process to determine how well they meet the criteria and constraints of the problem.</p> <p>MS-ETS1-3. Analyze data from tests to determine similarities and differences among several design solutions to identify the best characteristics of each that can be combined into a new solution to better meet the criteria for success.</p> <p>MS-ETS1-4. Develop a model to generate data for iterative testing and modification of a proposed object, tool, or process such that an optimal design can be achieved.</p>
Grades 9-12	<p>HS-ETS1-1. Analyze a major global challenge to specify qualitative and quantitative criteria and constraints for solutions that account for societal needs and wants.</p> <p>HS-ETS1-2. Design a solution to a complex real-world problem by breaking it down into smaller, more manageable problems that can be solved through engineering.</p> <p>HS-ETS1-3. Evaluate a solution to a complex real-world problem based on prioritized criteria and trade-offs that account for a range of constraints, including cost, safety, reliability, and aesthetics, as well as possible social, cultural, and environmental impacts.</p> <p>HS-ETS1-4. Use a computer simulation to model the impact of proposed solutions to a complex real-world problem with numerous criteria and constraints on interactions within and between systems relevant to the problem.</p>

Standard: SCI.ETS2: Students use science and engineering practices, crosscutting concepts, and an understanding of the *links among Engineering, Technology, Science, and Society* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.ETS2.A: Interdependence of Science, Engineering, and Technology	SCI.ETS2.A.K-2 Science and engineering involve the use of tools to observe and measure things.	SCI.ETS2.A.3-5 Science and technology support each other. Tools and instruments are used to answer scientific questions, while scientific discoveries lead to the development of new technologies.	SCI.ETS2.A.m Engineering advances have led to important discoveries in virtually every field of science, and scientific discoveries have led to the development of entire industries and engineered systems. Science and technology drive each other forward	SCI.ETS2.A.h Science and engineering complement each other in the cycle known as research and development (R&D). Many research and development projects may involve scientists, engineers, and others with wide ranges of expertise
SCI.ETS2.B: Influence of Engineering, Technology, and Science on Society and the Natural World	SCI.ETS2.B.K-2 Every human-made product is designed by applying some knowledge of the natural world and is built by using natural materials. Taking natural materials to make things impacts the environment.	SCI.ETS2.B.3-5 People's needs and wants change over time, as do their demands for new and improved technologies. Engineers improve existing technologies or develop new ones to increase their benefits, decrease known risks, and meet societal demands. When new technologies become available, they can bring about changes in the way people live and interact with one	SCI.ETS2.B.m All human activity draws on natural resources and has both short and long-term consequences, positive as well as negative, for the health of people and the natural environment. The uses of technologies are driven by people's needs, desires, and values; by the findings of scientific research; and by differences in such factors as climate, natural resources, and economic conditions. Technology use varies over time and from region to region.	SCI.ETS2.B.h Modern civilization depends on major technological systems, such as agriculture, health, water, energy, transportation, manufacturing, construction, and communications. Engineers continuously modify these systems to increase benefits while decreasing costs and risks. New technologies can have deep impacts on society and the environment, including some that were not anticipated. Analysis of costs and benefits is a critical aspect of decisions about technology.

		another.		
SCI.ETS2: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS				
Grades K-2	K-ESS3-3. Communicate solutions that will reduce the impact of humans on the land, water, air, and/or other living things in the local environment. 1-LS1-1. Use materials to design a solution to a human problem by mimicking how plants and/or animals use their external parts to help them survive, grow, and meet their needs.			
Grades 3-5	3-LS4-4. Make a claim about the merit of a solution to a problem caused when the environment changes and the types of plants and animals that live there may change. 4-ESS3-2. Generate and compare multiple solutions to reduce the impacts of natural Earth processes on humans.			
Grades 6-8	MS-LS2-5. Evaluate competing design solutions for maintaining biodiversity and ecosystem services. MS-LS4-5. Gather and synthesize information about the technologies that have changed the way humans influence the inheritance of desired traits in organisms. MS-ESS3-3. Apply scientific principles to design a method for monitoring and minimizing a human impact on the environment.			
Grades 9-12	HS-LS2-7. Design, evaluate, and refine a solution for reducing the impacts of human activities on the environment and biodiversity. HS-LS4-6. Create or revise a simulation to test a solution to mitigate adverse impacts of human activity on biodiversity. HS-ESS3-2. Evaluate competing design solutions for developing, managing, and utilizing energy and mineral resources based on cost-benefit ratios. HS-ESS3-4. Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.			

Standard: SCI.ETS3: Students use science and engineering practices, crosscutting concepts, and an understanding of the *nature of science and engineering* to make sense of phenomena and solve problems.

Learning Element	Performance Indicators (By Grade Band)			
	K-2	3-5	6-8	9-12
SCI.ETS3.A: Science and Engineering Are Human Endeavors	<p>SCI.ETS3.A.K-2 People of diverse backgrounds can become scientists and engineers.</p> <p>People have practiced science and engineering for a long time.</p> <p>Creativity and imagination are important to science and engineering.</p>	<p>SCI.ETS3.A.3-5 Science and engineering knowledge have been created by many cultures.</p> <p>People use the tools and practices of science and engineering in many different situations (e.g. land managers, technicians, nurses and welders).</p> <p>Science and engineering affect everyday life.</p>	<p>SCI.ETS3.A.m Individuals and teams from many nations, cultures and backgrounds have contributed to advances in science and engineering.</p> <p>Scientists and engineers are persistent, use creativity, reasoning, and skepticism, and remain open to new ideas.</p> <p>Science and engineering are influenced by what is valued in society.</p>	<p>SCI.ETS3.A.h Individuals from diverse backgrounds bring unique perspectives that are valuable to the outcomes and processes of science and engineering.</p> <p>Scientists' and engineers' backgrounds, perspectives, and fields of endeavor influence the nature of questions they ask, the definition of problems, and the nature of their findings and solutions.</p> <p>Some cultures have historically been marginalized in science and engineering discourse.</p> <p>Scientists and engineers embrace skepticism and critique as a community. Deliberate deceit in science is rare and is likely exposed through the peer review process. When discovered, intellectual dishonesty is condemned by the scientific community.</p>
SCI.ETS3.B: Science and Engineering Are Unique Ways of Thinking with Different Purposes	<p>SCI.ETS3.B.K-2 Scientists use evidence to explain the natural world.</p> <p>Science assumes natural events happen today as they happened in the past.</p> <p>Engineers solve problems to meet the needs of people and</p>	<p>SCI.ETS3.B.3-5 Science and engineering are both bodies of knowledge and processes that add new knowledge to our understanding.</p> <p>Scientific findings are limited to what can be supported with evidence from the natural world.</p>	<p>SCI.ETS3.B.m Science asks questions to understand the natural world and assumes that objects and events in natural systems occur in consistent patterns that are understandable through measurement and observation. Science carefully considers and evaluates anomalies in data and evidence.</p> <p>Engineering seeks solutions to</p>	<p>SCI.ETS3.B.h Science is both a body of knowledge that represents current understanding of natural systems and the processes used to refine, elaborate, revise and extend this knowledge. These processes differentiate science from other ways of knowing.</p> <p>Science knowledge has a history that includes the refinement of, and changes to, theories, ideas and beliefs over time.</p> <p>Science and engineering innovations may raise ethical issues for which science and engineering, by</p>

	communities.	<p>Basic laws of nature are the same everywhere in the universe (e.g. gravity, conservation of matter, energy transfer, etc.).</p> <p>Engineering solutions often have drawbacks as well as benefits.</p>	<p>human problems, including issues that arise due to human interaction with the environment. It uses some of the same practices as science and often applies scientific principles to solutions.</p> <p>Science and engineering have direct impacts on the quality of life for all people. Therefore, scientists and engineers need to pursue their work in an ethical manner that requires honesty, fairness and dedication to public health, safety and welfare.</p>	themselves, do not provide answers and solutions.
SCI.ETS3.C: Science and Engineering Use Multiple Approaches to Create New Knowledge and Solve Problems	<p>SCI.ETS3.C.K-2 Science and engineers use many approaches to answer questions about the natural world and solve problems.</p> <p>Scientific explanations are strengthened by being supported with evidence.</p> <p>An engineering problem can have many solutions. The strength of a solution depends on how well it solves the problem.</p>	<p>SCI.ETS3.C.3-5 The products of science and engineering are not developed through one set “scientific method” or “engineering design process.” Instead, they use a variety of approaches described in the Science and Engineering Practices.</p> <p>Science explanations are based on a body of evidence and multiple tests, and describe the mechanisms for natural events. Science explanations</p>	<p>SCI.ETS3.C.m A theory is an explanation of some aspect of the natural world. Scientists develop theories by using multiple approaches. Validity of these theories and explanations is increased through a peer review process that tests and evaluates the evidence supporting scientific claims.</p> <p>Theories are explanations for observable phenomena based on a body of evidence developed over time. A hypothesis is a statement that can be tested to evaluate a theory. Scientific laws describe cause and effect relationships among observable phenomena.</p>	<p>SCI.ETS3.C.h Scientists use a variety of methods, tools and techniques to develop theories. A scientific theory is an explanation of some aspect of the natural world, based on evidence that has been repeatedly confirmed through observation, experimentation (hypothesis-testing), and peer review.</p> <p>The certainty and durability of science findings varies based on the strength of supporting evidence. Theories are usually modified if they are not able to accommodate new evidence.</p> <p>Engineers use a variety of approaches, tools, and techniques to define problems and develop solutions to those problems. Successful engineering solutions meet stakeholder needs and safety requirements, and are economically viable. Trade-offs in design aspects balance competing demands.</p>

		<p>can change based on new evidence.</p> <p>There is no perfect design in engineering. Designs that are best in some ways (e.g. safety or ease of use) may be inferior in other ways (e.g. cost or aesthetics).</p>	<p>Engineers develop solutions using multiple approaches and evaluate their solutions against criteria such as cost, safety, time and performance. This evaluation often involves trade-offs between constraints to find the optimal solution.</p>	
--	--	---	--	--

SCI.ETS3: EXAMPLE THREE-DIMENSIONAL PERFORMANCE INDICATORS

Grades K-2	<p>K-ETS3-1. Compare data from two types of investigations (e.g. hands-on and computer-based games) to show that pushes and pulls of different strengths have different effects (PS2.A.K).</p> <p>1-ETS3-1. Construct an argument with evidence that humans today and long ago have used ideas from plants and animals to help them survive (LS1.A.1).</p> <p>2-ETS3-1. Design creative solutions to a problem caused when there is a quick change to the earth's surface (e.g. natural disasters) (ESS1.C.2).</p>
Grades 3-5	<p>3-ETS3-1. Obtain and evaluate information showing that different cultures have created different tools and technologies to survive in different types of environments (LS2.C.3).</p> <p>4-ETS3-1. Construct an explanation for how energy is transferred in a system, and then revise that explanation based on new evidence (PS3.B.4).</p> <p>5-ETS3-1. Investigate properties of materials to provide evidence as to which would best work within an engineering design solution (PS1.A.5).</p>
Grades 6-8	<p>MS-ETS3-1. Construct an argument supported by evidence about the values held by different societies based on the resources expended for exploration and understanding of the universe (ESS1.B.m).</p> <p>MS-ETS3-2. Evaluate information and evidence about issues related to genetically modifying organisms and identify questions that can, and cannot, be answered by science (LS3.B.m).</p> <p>MS-ETS3-3. Mathematically evaluate products of chemical and physical changes to support ideas of atomic theory (PS1.A.m).</p>
Grades 9-12	<p>HS-ETS3-1. Ask questions to clarify and author's motivation for promoting unscientific or falsified information on science topics (e.g. climate change, vaccines, GMOs, nuclear energy) (SEP.1.h).</p> <p>HS-ETS3-2. Create simulations of antibiotic resistance, showing how varying use of antibiotics over time has affected evolution of bacteria, and reflecting on how an understanding of the pros and cons of antibiotic use has changed over time (LS4.C.h).</p>

	HS-ETS3-3. Provide evidence that multiple approaches to understanding climate change have resulted in stronger theories of why change happens over time (ESS3.D.h).

DRAFT

Appendix A – Example connections to Wisconsin contexts and connections to Engineering, Technology, and Society

The vision for the new Wisconsin State Science Standards outlines the importance of providing opportunities for students to apply scientific thinking, skills, and understanding to real-world phenomena and problems. In order to achieve this, the standards document includes real-world connections that are specific to Wisconsin, as well as connections to engineering and technology, for most science content standard statements (some boxes are blank where the writing committee could not think of ideas). These connections are listed as a grade band progression, but most could be used at any grade level. The connections note which learning element progression they connect to (such as LS1.A). They are only provided for the Life Science, Physical Science, and Earth and Space Science sections. Engineering, Technology, and Society (ETS) is not called out as a separate section here; instead, those connections are provided in the context of science disciplines, as the standards intend for science and engineering to be integrated when not, not for engineering to be taught as a stand-alone subject. These sections are shaded grey to emphasize that these examples are not a required part of the standards. Teachers are encouraged to connect to local phenomena and meaningful engineering problems that make sense in their instruction and their community for their students.

LIFE SCIENCE				
Standard SCI.LS1: Students use science and engineering practices, crosscutting concepts, and an understanding of structures and processes (on a scale from molecules to organisms) to make sense of phenomena and solve problems.				
	K-2	3-5	6-8	9-12
SCI.LS1: CONNECTIONS				
Example Wisconsin Connections	<p>Wisconsin plants (e.g., burdock, maple trees, and black walnut trees) have structures for seed dispersal (LS1.A).</p> <p>Badgers' claws are long and sharp and allow them to dig quickly (LS1.A).</p>	<p>Explore concepts in this standard using native Wisconsin animals such as the grey wolf, badger, beaver, and red fox (LS1.A, B).</p> <p>Wood turtles respond to changing weather conditions by burrowing under the mud on the bank of a river and emerging again when conditions are favorable (LS1.A).</p> <p>Many species of Wisconsin bats hibernate during the winter (LS1.A).</p>	<p>Climate change has an effect on Wisconsin plants such as wild rice (LS1.B).</p> <p>Crops grown in Wisconsin can be converted to Biofuels (LS1.C).</p> <p>Genetically modifying crops can influence their growth (LS1.C).</p> <p>An animal's chance of survival may increase due to certain behaviors. Examples include:</p> <ul style="list-style-type: none"> --Winter "yarding" behavior among deer; --The seasonal migration of geese 	<p>Wisconsin Fast Plants allow students to investigate and model energy dynamics in living systems (LS1.C).</p> <p>By-products of fermentation industries are used to provide energy for the fermentation processes (LS1.C).</p> <p>Coppice cutting is a system of woodland management in Wisconsin that involves harvesting trees and allowing the stumps to produce new growth (LS1.B).</p>

			and cranes; --The hibernation of bears and bats (LS1.B, D).	
Engineering, Technology & Society Connections	Engineers use inspiration from nature in designs (biomimicry). Examples include Velcro and burr structures, and lotus leaf and waterproofing methods. Engineers design limbs for amputees.	Engineers design prosthetics and other artificial devices such as hearing aids and cochlear implants.	Engineers develop fuels from biological raw materials (biofuels). Engineers can alter biological organisms through genetic engineering.	One of the National Academy of Engineering Grand Challenges includes reverse engineering the brain to figure out how the brain works.

Standard SCI.LS2--Ecosystems: Students use science and engineering practices, crosscutting concepts, and an understanding of the *interactions, energy, and dynamics within ecosystems* to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.LS2: CONNECTIONS				
Example Wisconsin Connections	As with LS1, native Wisconsin organisms could be emphasized (LS2.A).	Red-winged blackbirds alert the others of a hawk overhead. Garter snakes hibernate in hibernacula in groups to retain temperature (LS2.D). Phosphorous flows into the streams and lakes and impacts algae growth (LS2.B).	The population of lake trout is declining in Lake Michigan (LS2.A). Predator and prey populations impact each other from year to year. Wisconsin examples of predators include wolves, coyotes, and bears, which limit the population of deer (LS2.A). Weather and climate variations are limiting factors on Wisconsin populations of deer, turkey, and eagles (LS2.A). Changes in deer populations affect biodiversity in forest ecosystems (LS2.C).	Relate the concept of carrying capacity to whitetail deer management (LS2.A). Investigate the interrelationship of the Isle Royale wolf and moose populations (LS2.A). Invasive earthworm disturbances in Wisconsin hardwood forests negatively affects native species (LS2.C). Evaluate the diversity of WI habitats (LS2.A, D).

Engineering, Technology & Society Connections	Engineers design buildings to be more sustainable such as green roofs, using energy and water more efficiently.	Engineered solutions to human problems (e.g. dams, bridges, and mega farms) impact the environment.	Engineers create artificial living environments such as biodomes.	Bioengineering: Engineers design systems to use microbes to break down waste. Engineers design solutions to physical disturbances caused by stormwater runoff from impervious surfaces.
	Engineers design systems to help food scarcity such as growing food in areas with little soil and water (hydroponics).		Engineers design solutions to create positive impacts from waste products: manure digesters, methane capture for energy at landfills, and abandoned coal mines.	

Standard SCI.LS3--Heredity: Students use science and engineering practices, crosscutting concepts, and an understanding of *heredity* to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.LS3: CONNECTIONS				
Example Wisconsin Connections	When growing Wisconsin Fast Plants, the seeds harvested from the plants grow into the same kind of plant (LS3.A, B).	WI Fast Plants have genetic variation in pigment in the stems (LS3.A, B).	Genetic engineering of bioluminescence is caused by genetic information being altered (LS3.A).	Genetic engineering of bioluminescence is caused by genetic information being altered. (LS3.A).
			People use knowledge of genetics and sexual reproduction to select for specific traits in animals, such as cows, and plants, such as agricultural crops (LS3.B).	People use knowledge of genetics and sexual reproduction to breed cows (LS3.B). Wisconsin Fast Plants can be used to test the effect of genetic and environmental factors (LS2.A, B). Genetic Analysis Using Online Bioinformatics Tools can be used to explore genetic and environmental factors (LS3.B). Sickle cell anemia and lactose intolerance vary in prevalence by different demographics (LS3.B).

Engineering, Technology & Society Connections				<p>Engineers alter gene expression through advanced biotechnology techniques to genetically modify organisms for increased production of human desired products.</p> <p>Better medicines can be engineered using knowledge of genetics.</p>
--	--	--	--	---

Standard SCI.LS4--Evolution: Students use science and engineering practices, crosscutting concepts, and an understanding of *biological evolution* to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.LS4: CONNECTIONS				
Example Wisconsin Connections	<p>Wisconsin and other Midwestern states have very different native species than states such as Florida or Arizona (LS4.A).</p>	<p>Fossils, such as trilobite fossils in Wisconsin, provide evidence of environmental changes (LS4.A).</p> <p>Bird sizes can vary due to differences in food and habitat. For example, Cooper's Hawks in Wisconsin are larger than Cooper's Hawks west of the Mississippi (LS4.B).</p>	<p>The discovery of ancient mammoths and mastodon remains documents the existence, diversity, extinction, and change of life forms in Wisconsin (LS4.A).</p> <p>The Wisconsin and Mississippi Rivers offer a barrier for gene flow for deer (LS4.C).</p> <p>Beaver populations influence trout fishing and affect biodiversity in other ways, including the impact of building activities on habitat (LS4.D).</p> <p>The loss of wetlands, and the alteration of prairies to agricultural use and then back to prairies, has resulted in changes in biodiversity (LS4.D).</p> <p>Loss of old growth forest is due to human influences (LS4.D).</p>	<p>Data on fish limits and sizes in licensing over time can be analyzed to study the resulting effects on fish populations (LS4.C, D).</p> <p>Diatoms provide data for study of population dynamics (LS4.C, D).</p> <p>Whooping cranes provide an example of sustaining biodiversity (LS4.D).</p> <p>The biodiversity index of local schoolyards or nearby natural areas could be measured before and after conservation efforts (LS4.D).</p>

Engineering, Technology & Society Connections		Engineer better habitats for zoo animals.	Engineers use genetic engineering to attain specific traits in livestock and crops.	Adaptations for bird flight relates to aeronautical engineering. Vaccines need to change to compete with evolving bacteria and viruses. Crop diseases, pesticide resistance in plants and insects are examples of natural selection.

PHYSICAL SCIENCE

Standard SCI.PS1: Students use science and engineering practices, crosscutting concepts, and an understanding of ***matter and its interactions*** to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.PS1: CONNECTIONS				
Example Wisconsin Connections	<p>Lakes freeze in the winter and thaw again in the spring (PS1.B).</p> <p>The heat from an oven causes a change to cookie dough that is irreversible (PS1.B).</p> <p>Different materials used for surfaces on playgrounds (sand, grass, asphalt, rubber, etc.) can be compared based on observable</p>	<p>Studying the chemistry of soil helps a farmer plan for how to support crop growth (PS1.A, B).</p> <p>Ore mining methods are dependent on the properties of the materials (PS1.A).</p> <p>White residue observed on roads after winter is evidence of conservation of matter (PS1.B).</p>	<p>Changes in chemical composition of bodies of water can be observed over time and analyzed to understand relationships in chemical processes. (PS1.A, B)</p> <p>Salt is used to lower the melting point of ice found on roads so that the ice will melt even when temperatures are lower than 32 degrees F or 0 degrees C (PS1.A).</p> <p>Chemical reactions are an important part of Wisconsin's dairy industry (PS1.B).</p>	<p>The La Crosse, Point Beach, and Kewaunee Nuclear Plants provide (or provided) electrical power to communities across Wisconsin (PS1.C).</p> <p>A chemical process can be used to convert cellulosic biomass to ethanol so that it can be used as a fuel source (PS1.A).</p> <p>Evidence of oxidation on metal surfaces differs based on the type of metal (PS1.B).</p>

	properties (PS1.A).			
Example Engineering, Technology & Society Connections	Engineers and materials scientists evaluate properties of materials to identify possible uses (such as making a shelter for Wisconsin weather conditions).	Engineers evaluate different materials for bridge design and repair.	Different metals are used based on the range of temperatures that will be encountered. Hot and cold packs use chemical reactions.	Engineers design and optimize polymers for certain applications. Engineers explore and improve designs for water softeners, noting why we need them in Wisconsin. Engineers create biofuels and/or compare combustion of different fuel types.

Standard SCI.PS2: Students use science and engineering practices, crosscutting concepts, and an understanding of *forces, interactions, motion and stability* to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.PS2: CONNECTIONS				
Example Wisconsin Connections	The strength of the hit to a hockey puck influences how far it will travel (PS2.A). Equipment on a school playground can be used to illustrate pushes and pulls (PS2.A).	Local summer fairs, carnivals, and amusement park rides illustrate unbalanced forces and the gravitational force (PS2.A, B). Collisions during a Green Bay Packers game illustrate unbalanced forces (PS2.A).	Increased static electricity in Wisconsin's dry winters can exemplify forces acting at a distance (PS2.B).	The Northern lights visible in Northern Wisconsin are caused by Earth's magnetic fields (PS2.B).
Example Engineering, Technology & Society Connections	Engineers design games or model playground equipment that incorporate pushes or pulls.	Engineers design toys, transportation methods, or simple machines that use gravitational, magnetic, or other forces.	Engineers develop solutions related to collision safety (e.g. car safety design or sports helmets). Local construction projects illustrate multiple aspects of forces, motion, and interactions.	Engineers design devices that use magnetic levitation to solve a problem. Engineers design electrostatic devices to serve as recycling sorters or electromagnetic devices to generate electricity or pick up objects.

Standard SCI.PS3: Students use science and engineering practices, crosscutting concepts, and an understanding of **energy** to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.PS3: CONNECTIONS				
Example Wisconsin Connections	<p>During different seasons or weather,, observe patterns in how much sunlight warms objects in the schoolyard (PS3.C).</p> <p>Solutions to reduce the heating effect of the sun include ginseng producers putting up shades for their plants; creating shade in a park or at the community garden; shade cloth at garden centers to create shade for plants that require partial to full shade (PS3.D).</p>	<p>Wind and solar power can be compared between locations and climates (PS3.A).</p> <p>Electrical energy is produced in many ways. Research how your “local” power plant makes electrical energy (PS3.C).</p>	<p>Maple syrup production incorporates several energy topics including how temperatures above 0°C cause a positive pressure inside of a tree, which can result in the flow of sap. The heat used to boil off excess water and create the syrup (PS3.A).</p> <p>Biofuels also provide a great example related to energy conversions and energy of a system (PS3.D).</p>	
Example Engineering, Technology & Society Connections	<p>Engineers design solar ovens to heat food and shading devices to reduce heat from the sun.</p>	<p>Engineers design turbine blades for wind and water power.</p> <p>Engineers solve problems through effective design of electrical circuits.</p>	<p>Engineers design insulated containers for food or other perishable items (e.g. vaccines in areas with hot climates and limited refrigeration).</p>	<p>Engineers investigate possibilities for making solar power more affordable or processes related to artificial photosynthesis.</p>

Standard SCI.PS4: Students use science and engineering practices, crosscutting concepts, and an understanding of **waves and their applications in technologies for information transfer** to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.PS4: CONNECTIONS				
Example Wisconsin Connections	<p>Odd noises occur in Clintonville due to the earth moving (PS4.A).</p> <p>Sounds are produced in a variety of ways during different seasons--birds, ice cracking, mosquitoes, etc. (PS4.A).</p>	<p>Waves and their impacts can be observed at local bodies of water (PS4.A).</p> <p>Students can research how we use patterns to send information (e.g. AM vs FM radio signals) (PS4.A).</p>	<p>Students can explore how sounds of insects above and below water can be related to predation (PS4.A).</p> <p>The Wisconsin Emergency Broadcast System uses waves to communicate. Students can consider ways to improve this system (PS4.C).</p>	<p>The placement of cell towers and strength of signals influence service quality across Wisconsin (PS4.C).</p> <p>Wave speed and other phenomena can be used to detect Earth or ice quakes (PS4.A).</p>
Engineering, Technology & Society Connections	<p>Engineers design better methods to transmit sound, such as a "better" cup and string phone.</p> <p>Engineers use light and sound to communicate a message over a distance.</p>	<p>Engineers design strategies to aid color blind people in distinguishing between colors.</p> <p>Engineers design better speakers or headphones, building on knowledge of how they generate sound.</p>	<p>Ultrasound machines, fish finders, and ocean sonar equipment use waves to measure distance.</p> <p>Remote controls use radio waves or infrared radiation to communicate and transmit digital information.</p> <p>Engineers design earthquake resistant structures.</p>	<p>Using observations at different electromagnetic wavelengths helps astronomers explore the universe. Amplitude modulation and frequency modulation transmit information using radio waves; each may be used for different reasons.</p> <p>DVDs, flash drives, servers, and other electronic storage devices work differently and are appropriate for different applications.</p>

Content Area: EARTH AND SPACE SCIENCE

Standard SCI.ESS1: Students use science and engineering practices, crosscutting concepts, and an understanding of *Earth's place in the universe* to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.ESS1: CONNECTIONS				

Example Wisconsin Connections	In Wisconsin there are patterns related to seasons, solar intensity, length of daylight, and location of the sun in the sky at different times of the year (ESS1.A, B).	Across Wisconsin, various landforms give evidence of ancient plate tectonics, erosional forces, and more recently - glacial activity (ESS1.C).	Yerkes Observatory in Williams Bay, WI was built in 1897 and is still the world's largest refractor telescope; it continues to be used for astronomical research (ESS1.A). Wisconsin rock strata show evidence of Precambrian Penokee mountain range (once as high as the Rockies) that were later eroded down and gave way to Paleozoic shallow seas to form sedimentary rock layers during Cambrian to Devonian Periods (ESS1.C).	Unique geographical provinces exist across Wisconsin (ESS1.C). Wisconsin has experienced numerous tectonic events throughout earth's history. These events were instrumental in forming many of our present landforms such as the Baraboo hills and Penokee Mountains (ESS1.C). Landforms such as moraines, drumlins, eskers, kames, kettles, buried forests, erratic boulders, outwash plains, and glacial lakes are evidence of glacial advances and retreats (ESS1.C). The geology and terrain of Wisconsin can provide evidence of our glacial history. The movements of past ice sheets brought about changes in the landscape seen today. The National Scenic Ice Age Trail provides examples and information (ESS1.C).
Engineering, Technology & Society Connections	Weather data in Wisconsin is collected by citizen scientists throughout the state.	Geological features of a community influence where a bridge, landfill, hydroelectric dam, etc. should be placed.	Reverse engineer a telescope to see how it is constructed and how it is designed for a purpose. There are applications of 3D printing in space technology.	NASA Engineers work on advances to air and space systems to support "highways in the sky," "smart aircraft," human missions, and other space endeavors. Development of new high-tech industries enable humans to forecast and assess the health of the Earth system.

Standard SCI.ESS2: Students use science and engineering practices, crosscutting concepts, and an understanding of *Earth's systems* to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.ESS2: CONNECTIONS				
Example Wisconsin Connections	Beavers change their environment to meet their needs (ESS2.E). Wisconsin has several different growing zones	Wisconsin is home to about 15,000 inland freshwater lakes (most are glacially formed). Our state borders two of the five Great Lakes,	Earthquakes are very rare across Wisconsin, as seen in USGS Data (ESS2.B). Recent and historical climate data for Wisconsin is maintained by the	Weather and climate in Wisconsin is complex and varied, depending on topography, elevations, water body proximity, and human interactions. These natural and anthropogenic interactions occur both locally and globally (ESS2.D).

	which determine plantings (ESS2.D).	which are the largest collection of freshwater lakes in the world by total area, and contain 21% of Earth's surface fresh water by volume (ESS2.C). Wisconsin has different climate patterns than other parts of the U.S. and world (ESS2.D).	State Climatology Office and NOAA (ESS2.D).	
Engineering, Technology & Society Connections	Engineers develop solutions that are specific to environmental and climatic needs (de-icing an airplane, heating and cooling systems in houses).	The National Academy of Engineering suggests work with the “Grand Challenge” of providing access to clean water (water purification, small and large scale).	Engineers design systems to harness energy from water (hydropower), the Earth (geothermal), tides, solar, etc.	Engineering can generate and support solutions to a changing climate. Farmers minimize natural hazards in agriculture in multiple ways, using sprinkler systems in cranberry bogs to mist plants when there is frost danger in spring; wind machines at vineyards to displace cold air and reduce frost damage to budding vines in spring; practices to reduce soil erosion (no till farm fields; landscape designers using products to hold soil in place while new plantings grow).

Standard SCI.ESS3: Students use science and engineering practices, crosscutting concepts, and an understanding of the *Earth and human activity* to make sense of phenomena and solve problems.

	K-2	3-5	6-8	9-12
SCI.ESS3: CONNECTIONS				
Example Wisconsin Connections	Citizens use groundwater in Wisconsin for drinking and to grow food (ESS3.A). Agriculture practices across Wisconsin vary	The world’s reserves for nonrenewable fuel sources (crude oil, natural gas, and coal) are limited. Wisconsin is home to fuels, frac sand mining, wind, solar, and hydropower (ESS3.A, C).	In the early 2010’s, Wisconsin used about one-third of its corn crop to produce hundreds of millions of gallons of ethanol each year. There are impacts from mining of Wisconsin sand for fracking and upgrading transmission infrastructure across Wisconsin (ESS3.A).	Historical ice in and ice out data for lakes across the state can be compared to global climate models (ESS3.D).

	based on soil type, climate, and culture (ESS3.A).		<p>Ecological footprint calculators allow students to analyze how personal choices impact Earth's resources (ESS3.A, C, and D).</p> <p>Global climate change impact on wild rice harvest across Wisconsin (ESS3.A, C, and D).</p> <p>Historical WI weather service data on severe weather impacts are available (ESS3.B).</p>	
Engineering, Technology & Society Connections	Engineers identify solutions to provide alternatives that reduce human impacts on the environment.	Engineers create designs to lessen impacts of extreme events, such as earthquake resistant structures and Tsunami warning systems.	Engineers work on harnessing energy from new sources and improve existing means to get energy.	<p>A National Academy of Engineering Grand Challenge is to develop carbon sequestration methods.</p> <p>Engineer development looks to balance different, and often competing, needs against an awareness of the environmental, social and economic limitations we face as a society.</p>
